EXECUTIVE SUMMARY

The Penobscot Bay Conservation Plan is the product of a 12-month study of the coastal wildlife resources of 36 towns in Penobscot Bay.

Two hundred and thirty coastal wildlife concentration areas were identified, mapped, and evaluated during this study. These areas provide significant habitats for more than 100 species of coastal birds and two species of seals. All of these animals rely on the biological productivity and physical characteristics of these areas for some portion(s) of their annual cycle.

Forty-six (20%) of these wildlife areas were determined to be of state or national significance based on the seasonal species composition and relative abundance of the wildlife using them, and are designated as Class A habitats. Seventy (30%) of the concentration areas were recognized to be of regional importance (Class B habitats). The remaining 114 (50%) areas are locally significant for coastal wildlife in Penobscot Bay and are designated as Class C habitats. Ninety-eight percent of all coastal wildlife sighted in the Bay during the aerial surveys and ground checks were located in the 230 concentration areas.

Recommendations for protecting the Class A, B, and C habitats are presented, including specific management guidelines for Special Wildlife Features, such as eagle nests, seabird nesting islands, and heron colonies. Specific applications of this information by municipal and state land-use planners, resource managers, and conservation organizations are discussed.

Maps for each of the 36 towns show the location of all Class A, B, and C coastal wildlife habitats and Special Wildlife Features. Supporting tables list the species or species groups using each area.

The geographic region evaluated in this report includes all islands, exposed ledges, tidal waters and adjacent shorelines of the area bounded by the Veazie dam on the north, Matinicus Rock on the south, Graffam Island (Muscle Ridge) on the west, and Long Island (Frenchboro) and Naskeag Point (Brooklin) on the east.

ACKNOWLEDGMENTS

The authors wish to gratefully acknowledge the many individuals who contributed skills and energies towards the production of this plan. We are especially grateful to Andy Stinson of Central Maine Flying Service, and Russ Treadwell of Wilderness Wings, who served as pilots for the survey. Their skill and dedication through long hours of flying under very demanding conditions were essential to the completion of this study.

Art Ritter, Maine Department of Inland Fisheries and Wildlife (MDIFW), deserves special thanks for coordinating all computer data analyses.

For their meticulous attention to detail and insistence on quality through all phases of the map preparation, we give particular recognition to Beth Swartz and Robert Stratton.

Tom Chamberlain, MDIFW, provided enthusiastic and expert technical advice on graphics preparation.

Richard Chipman deserves special thanks for conducting the ground survey of shorebird feeding areas.

Charlie Todd, MDIFW Endangered and Nongame Wildlife Program, provided data on Penobscot Bay's bald eagle population and contributed to the development of the bald eagle management guidelines.

The Hancock County Regional Planning Commission, Eastern Maine Development Corporation, and Eastern Mid-Coast Regional Planning Commission were very helpful in providing access to their excellent maps.

We are especially grateful to Betty Jackson, MDIFW, for typing all drafts and revisions of the report.

This study and report were funded by the Maine State Planning Office from Maine's Coastal Management Program through funding provided by the U. S. Department of Commerce, Office of Ocean and Coastal Resource Management, under the Coastal Zone Management Act of 1972, as amended, and from The Endangered and Nongame Wildlife Fund of the Maine Department of Inland Fisheries and Wildlife.

PROJECT DESCRIPTION

Introduction

Coastal Maine is a highly productive biological environment, providing food and shelter for 150 species of marine-related birds (Palmer 1949, Packard 1960, TRIGOM-PARC 1974) and 26 species of marine mammals (Fefer and Schettig 1980). This diverse assemblage includes seabirds, shorebirds, seals, wading birds, waterfowl, and raptors. All of these animals share a dependence on the biological and physical characteristics of Maine's coastal environment for some segment(s) of their annual cycle.

This diverse array of wildlife includes rare and endangered species, as well as species spectacular in their abundance; and represents a resource that is of international, state, and regional significance. The values of this resource are economic, aesthetic, cultural, ecological, educational, and scientific.

Coastal wildlife are an integral component of the "mystique and character of Maine", and are therefore directly related to the economic growth of the state from escalating tourism, immigration, and commercial development. The direct and indirect economic values of coastal wildlife can be measured in the millions of dollars.

Ironically, Maine's wildlife, along with many other coastal resources, are being jeopardized by the very development they have "promoted". A balance between exploitation and conservation must be achieved if we are to retain the long-term values of the wildlife resource.

The eleven core laws of Maine's Coastal Program provide a regulatory mechanism for "achieving a balance between conservation and development in the coastal area that will satisfy short-and long-term social, economic, and environmental needs" (Appendix I). However, these laws cannot be effectively implemented to conserve the habitats supporting Maine's coastal wildlife without: 1) an information base which identifies and assigns priority to significant resource areas; and 2) specific guidelines and defensible performance standards for human activities and development within and adjacent to these resource areas.

The Penobscot Bay Conservation Plan addresses these deficiencies by providing the first comprehensive, prioritized,

site-specific information on coastal wildlife populations and their habitats for Penobscot Bay. Specific recommendations for conserving the resources within these wildlife habitats are provided. These guidelines can be implemented through the eleven environmental core laws, public and private voluntary land-protection initiatives (ie. direct acquisition, conservation easements, etc), and public education programs.

Natural resource planners, managers, and conservation groups can now focus on the most significant coastal wildlife areas, facilitating efficient and effective use of limited personnel and funds.

Study Objectives

The objectives of this study were:

1. To identify all areas of concentrated use by marine birds and seals in Penobscot Bay.
2. To develop an evaluation system for these areas that orders them by their need for conservation and management.
3. To develop land and water-use guidelines for the conservation of these areas.
4. To assist state and local planners, resource managers, and conservation organizations with incorporating wildlife values into planning and development of coastal resources.

Study Area

The area evaluated in this report includes all islands, exposed ledges, tidal waters and adjacent shorelines of the area bounded by the Veazie dam on the north, Matinicus Rock on the south, Graffam Island (Muscle Ridge) on the west, and Long Island (Frenchboro) and Naskeag Point (Brooklin) on the east. NOAA marine charts 13303, 13305, 13309, 13313, and 13316 cover this area and were used to reference all geographic locations. The region encompasses more than 1,000 square miles and includes more than 600 miles of shoreline, 7,500 acres of intertidal mudflats, 1,000 acres of saltmarsh, and 900 islands and exposed ledges (Figure 1).

Figure 1. Penobscot Bay Study Area.

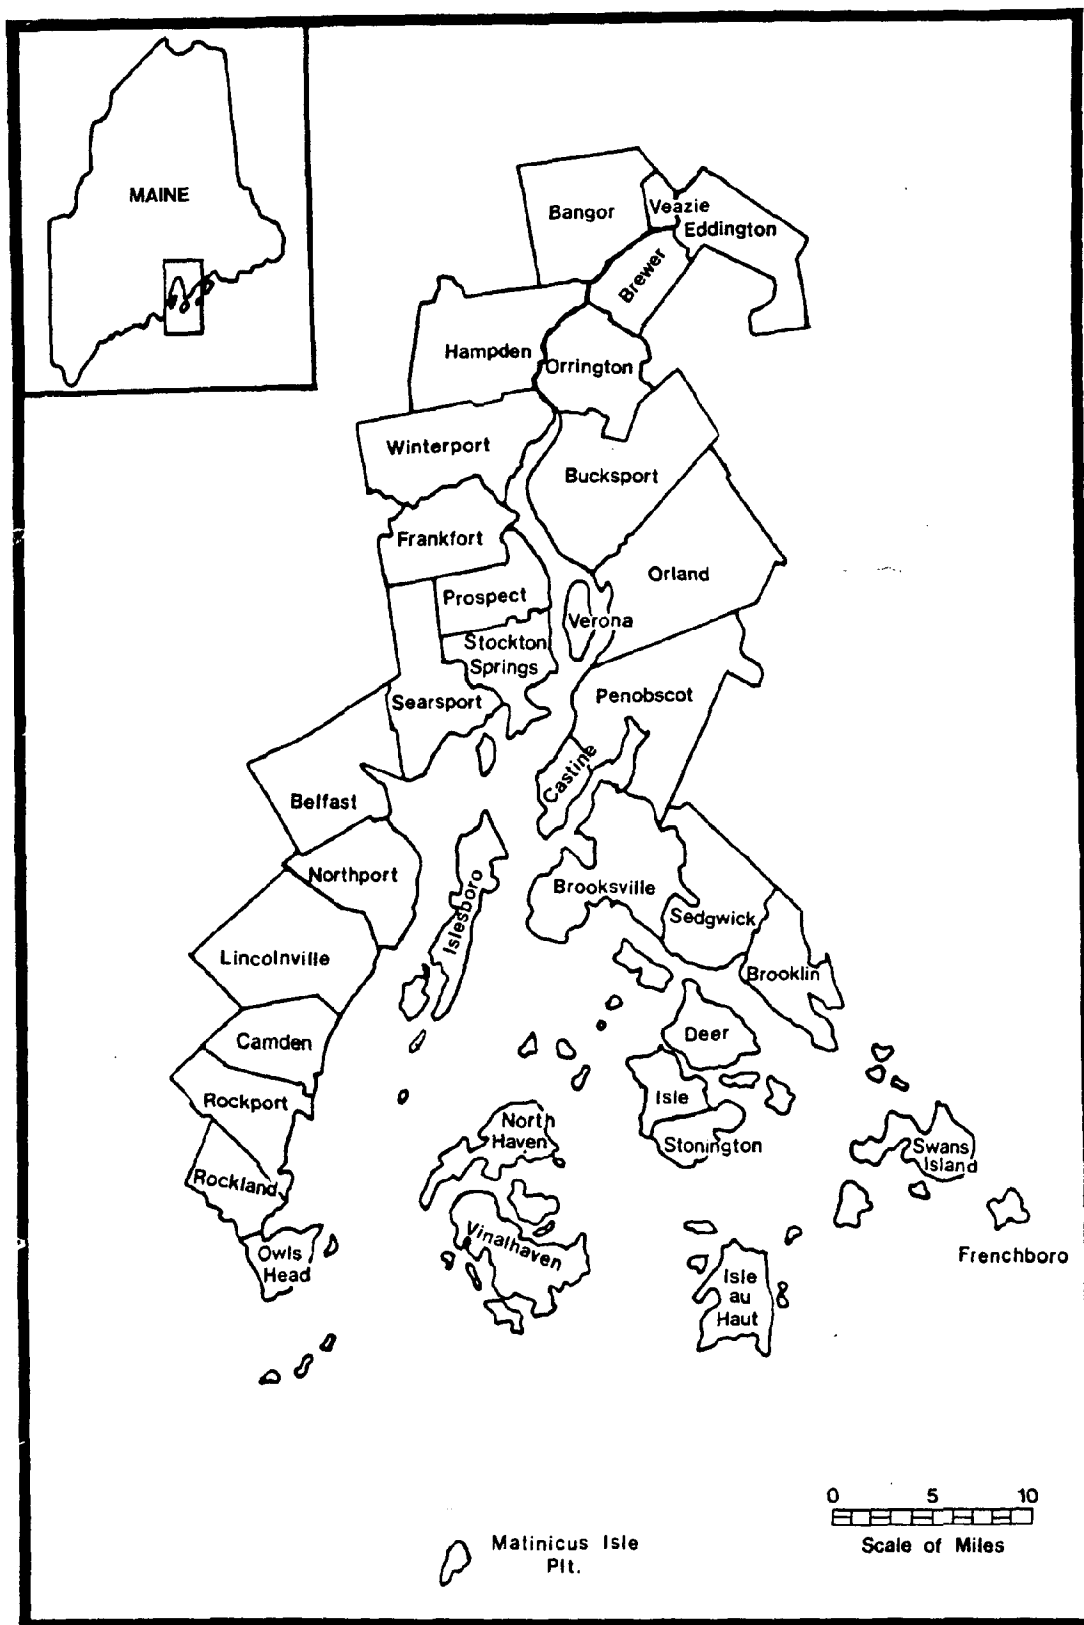

Table 1. Season and dates of Penobscot Bay aerial surveys.

Winter	December 12 and December 22, 1985 January 17 and January 19, 1986
Spring Migration	February 27 and February 28, 1986 April 1 and April 4, 1986
Nesting	May 5 and May 14, 1986 June 26, July 1 and July 2, 1986
Post-nesting	July 29, August 1 and August 6, 1986 August 14 and August 23, 1985
Fall Migration	September 16 and September 17, 1985 October 17 and October 18, 1985 November 14 and November 18, 1985

METHODS

Resource Inventory

A combination of aerial and ground surveys and censuses was used to document the species composition, geographic distribution and numbers of marine birds and seals. Low-level aerial flights served as the primary method because they provided the comprehensive, "snap-shot" overview of the Bay's wildlife, which could not be acquired by any other method. Aerial surveys were also the best method for locating the nests of bald eagles, ospreys, and great blue herons. Ground surveys and censuses complemented aerial surveys by providing accurate census information for ground-nesting waterbirds and shorebirds, and by verifying the flight data.

All ground and aerial observations were coded and mapped on NOAA 1:40,000 marine charts and transferred to computer files for data analyses.

Aerial Surveys and Censuses. Eleven aerial surveys of the Penobscot Bay study area were completed between 14 August 1985 and 6 August 1986 (Table 1). Each survey required two to three days of flying and averaged 15 hours. A Cessna Skyhawk or a dual-engine Cessna Skymaster was used for all flights. Surveys were flown at an altitude of approximately 300 feet and a speed of approximately 100 mph, and covered all tidal waters within the study area.

All sightings of marine birds or seals were recorded on voice tape and included identification to species or species group, estimated numbers and geographic location.

Ground Surveys and Censuses

Nesting Marine Birds. All islands and ledges within the study area were evaluated for the presence of nesting marine birds between 3 May and 29 July 1986. Wherever nesting was suspected, biologists landed on the island and searched all suitable cover for nests. Possible nesting was indicated by historic records, the sighting of birds, or the presence of suitable habitat. Islands found with nesting marine birds were censused using direct nest counts and/or visual estimates of adult birds. In those cases where the number of adult birds sighted substantially exceeded the numbers of nests observed, it was assumed that the excess adults were nonbreeders, and the estimate of nesting pairs was

based primarily on the nest counts. In general, survey and census methods followed Hutchinson and Ferrero (1981), Hutchinson and Lovett (1983, 1984), and Korschgen (1979).

Shorebirds. During the period 14 August through 12 September 1985, 116 intertidal sites were checked for use by feeding shorebirds. A comprehensive inventory of the Penobscot Bay area was not possible because of the tremendous amount of shoreline offering potential feeding sites and the relatively short period of time available for assessing the shorebird population. However, by combining information on the ecology of Maine's shorebirds, historic records, and intertidal substrate data from NOAA marine charts, sites likely to be of primary importance to feeding shorebirds were identified. Additional sites were surveyed when time and access permitted.

Every attempt was made to visit sites at a falling tide as the flats emerged, but before birds became dispersed. Time, tide phase, weather, and flat substrate were noted for each site. The flat was then scanned with binoculars and/or a spotting scope until reasonable species identifications and estimates of the numbers of birds could be made. Shorebird use of feeding areas is dynamic - with both species composition and abundance varying greatly throughout the tide cycle. We attempted to make observations at a time when both maximal numbers and species would occur.

Shorebird roosting areas were located primarily during the aerial surveys. Birds are more concentrated on roost sites and flush more readily than when feeding, thus facilitating aerial sightings.

Resource Evaluation and Mapping

Identification and Ranking of Wildlife Areas. Wildlife concentration areas were identified by the presence of multiple mapped observations. They were delineated by drawing a line around the clumped observations seaward to the thirty foot depth contour when possible, or a distance of approximately 300 feet from the central geologic feature with which the animals were associated. For those areas adjacent to the mainland, or islands other than seabird nesting islands, the shoreward limit of the wildlife area is 250 ft. above mean high water. All seabird nesting islands are included in their entirety within a wildlife area. Seaward limits were selected based on reported average

feeding depths for the marine birds found in Penobscot Bay (Palmer 1976 a and b, Adamus 1978). The 250 foot shoreland zone recognizes the ecological relationships between shoal-water marine systems and the adjacent terrestrial communities. Both flight and ground census data were coded by area for each species and entered into computer data files.

Five seasons were identified for this study, corresponding to the seasonal biological rhythms and major movement of marine birds and seals in northern New England. Seasonal dates were determined from the literature (Palmer 1949, TRIGOM-PARC 1974, Korschgen 1979) and from patterns of population stability and change seen during this and previous studies (Hutchinson and Ferrero 1981, Hutchinson and Lovett 1983, 1984). The dates are not absolute, but are only guides. Overlap naturally occurs from one season to the next. By compiling and analyzing the data on a seasonal basis, a conceptual framework is provided which allows for a better understanding of the resource and the development of more refined management strategies.

Approximate dates for the five seasons are:

Winter	December 1 to February 15
Spring migration	February 16 to April 30
Nesting	May 1 to June 30
Post-nesting	July 1 to August 31
Fall migration	September 1 to November 30

Both seasonal and composite ratings were calculated for each area based on the relative abundance and diversity of species found there. An area's seasonal ratings were derived by calculating, for each species, the percentage of its total population in Penobscot Bay found within that area that season. The sum of the percentages for all species found within that area, that season, was the area's seasonal rating. The area's composite rating is the average of its five seasonal ratings.

This composite rating is then used to assign the area to one of three classes: Class A (State or National Significance), Class B (Regional Significance) or Class C (Local Significance). Conservation guidelines were developed for each of the classes. Maps were prepared for each of the thirty-six towns in the study area to show the location of all Class A, B and C areas.

Identification of Special Wildlife Features. A Special Wildlife Feature is a specific site of use by coastal wildlife and is usually encompassed by a Class A, B or C Area. The Special Wildlife Features identified in this study and the criteria used for designating sites are:

- 1) Bald Eagle Nest Site - presence of an active bald eagle nest in 1986, or overlap of an area with any of the restricted-use buffer zones around an eagle nest (see Management Guidelines for Bald Eagle Nest Sites).
- 2) Osprey Nest Sites - presence of an osprey nest in 1986.
- 3) Colonial-nesting Seabird Islands - presence of nesting seabirds in 1986, or recurrent historical use where the habitat is still intact.
- 4) Shorebird Feeding or Roosting Areas - presence of an average of 20 or more shorebirds during any season.
- 5) Great Blue Heron Colonies - presence of a heron colony in 1986.
- 6) Eider Molting Sites - presence of 200 or more flightless eiders during at least three of the four aerial surveys in the period 22 July through 18 October.
- 7) Seal Haul-outs - presence of 5 or more adults or pups at a haul-out site.

Management guidelines were developed for each of these types of Special Wildlife Features, whose locations are shown on the town maps.

FINDINGS

Wildlife Values of Penobscot Bay

Two hundred and thirty coastal wildlife concentration areas were identified through this study (Table 2). These areas provide significant habitats for approximately 100 species of coastal birds and two species of seals (Table 3).

Ninety-eight percent of all coastal wildlife sighted in the Bay during the aerial surveys and ground checks were located in these concentration areas, which cover less than 15% of the Penobscot Bay study area.

Forty-six (20%) of these wildlife habitats, determined to be of state or national significance, were designated as Class A habitats (Table 4, Figure 2) based on the seasonal species composition and relative abundance of the wildlife using the areas. Seventy (30%) of the concentration areas, recognized to be of regional importance, were designated as Class B habitats. The remaining 114 (50%) areas are locally significant for coastal wildlife in Penobscot Bay and were designated as Class C habitats (Appendix II).

Class A habitats supported 40% of the average annual population of coastal wildlife (all species) in Penobscot Bay. Class B and C habitats supported 35% and 25% respectively (Table 5).

One hundred and eighty-three of the Class A, B and C habitats (80%) supported one or more Special Wildlife Features. These include ten active eagle nests, three of which were unknown prior to this study; five great blue heron colonies; one hundred and twenty-three colonial-nesting seabird islands; and seventy-one shorebird feeding and roosting areas.

Class A wildlife habitats alone support more than 50% of these wildlife features - additional justification for directing major protection efforts towards these areas.

Maintenance of the existing distribution, diversity and abundance of Penobscot Bay's coastal wildlife depends on the continued availability of the significant Class A, B and C habitats as undisturbed, biologically productive areas. Recognizing the escalating demands for access to and development of the coastal zone containing these areas, we recommend the following guidelines for appropriate uses and levels of activity within each habitat classification

to assist in the development and implementation of resource allocation strategies which will balance development and protection with the goal of maintaining Penobscot Bay's wildlife values.

This challenge of preserving our coastal wildlife heritage will require an exceptional level of commitment and cooperation among all Maine's citizens, but the rewards will far exceed the effort, and will be visible for generations to come.

Wildlife Conservation in Penobscot Bay

Conservation of the biological productivity and diversity of Class A, B, and C wildlife habitats depends on man's ability to control the types and intensities of human activities within these areas. Guidelines to assist in the identification of appropriate types and levels of use within each of the three habitat categories are presented in the following section.

Additional specific management recommendations are provided for Special Wildlife Features such as Bald Eagle Nest Sites, Great Blue Heron Colonies, and Colonial-nesting Seabird Islands.

Applications of our findings and management guidelines to coastal resource allocation problems and processes are also presented.

Conservation guidelines for Class A, B, and C wildlife habitats are as follows:

1. Class A - Definition: An area of national and/or state significance for coastal wildlife.
 - a. The existing habitat should not be degraded through alteration or development of the intertidal and submerged lands, or the shoreland buffer zone (250 ft. above mean high tide). Activities within these areas should not alter the existing biological community structure and function. Indigenous species populations should be maintained at (or exceed) existing levels.
 - b. A detailed land-use/wildlife conservation plan should be a required component of each town's comprehensive plan. This should be a cooperative effort by local land use planners and MDIFW personnel.
 - c. In general, Class A areas should not experience any changes in the type or increases in the intensity of existing use.
 - d. The most significant Class A areas should be targeted for special protection through inclusion in the MDIFW Coast of Maine Wildlife Management Area and/or Maine Coast Heritage Reserve.

2. Class B - Definition: An area of regional significance for coastal wildlife.
 - a. The existing habitat should be maintained in sufficient quality and quantity to support all coastal wildlife species indigenous to the area.
 - b. Types of activities and development within the area should not be modified; however, the intensity of use or development may be increased. A 40% increase in the intensity of compatible uses is suggested as an upper limit.
 - c. A land-use/wildlife conservation plan should be developed detailing specific wildlife values and identifying compatible human uses of the area.
3. Class C - Definition: An area of local significance for coastal wildlife.
 - a. Both the types and intensities of existing uses could be modified. However, the general character of the area should remain intact. An increase of 75% in compatible uses is probably acceptable. Activities in these areas should not alter the structure and function of the resident biological community.
 - b. A land-use/wildlife conservation plan should be developed.

MANAGEMENT GUIDELINES FOR SPECIAL WILDLIFE FEATURES

MANAGEMENT GUIDELINES FOR BALD EAGLE NEST SITES

Introduction. Bald eagles are the largest bird in Maine, having a wingspan of 7 to 8 feet and weighing between 8 to 15 pounds. They attain their adult plumage (a white head and tail) at 5 years of age, at which time they choose a mate for life. Bald eagles build large stick nests usually in prominent white pines or spruces located within one mile of marine habitats, shallow lakes and ponds, or along larger rivers. A pair of eagles returns to the same nest site yearly and will sometimes maintain up to 7 nests within their nesting territory. Bald eagles eat primarily bottom-dwelling fish during the summer months, but shift their diet to birds (primarily waterfowl and gulls) and carrion during the winter. Adult eagles remain near their nest year-round, however, young eagles may wander as far south as Chesapeake Bay before returning to Maine to nest. Eagles from Maine and the region from the Maritime Provinces and Ontario to Saskatchewan are known to winter in Maine. In addition to nesting areas, bald eagles require perch sites and winter roost sites located near feeding areas.

Status. The bald eagle was declared an Endangered Species on the Federal Register in Maine and 43 other states in 1978, and is listed as endangered on the State of Maine Endangered Species List. Maine has the only nesting population of bald eagles in New England. In 1986, 85 pairs of eagles were found nesting in Maine and produced 75 young. Penobscot Bay has 10 active and 4 historic bald eagle nesting territories (Table 6). Reproductive rates in Maine remain lower than other populations in North America. However, because of the increased survival of young eagles, due in part to a winter feeding program, the population is still increasing. Protection of traditionally used nesting territories is a key factor in the long-term recovery of Maine's bald eagle population.

Problems. Human influences such as disturbance around nest sites, shooting, environmental pollution, and habitat alteration have affected bald eagle populations. Bald eagle numbers in Maine began a slow but steady decline in colonial times, primarily as the result of habitat loss and human persecution. This decline was greatly accelerated in Maine after 1945, when DDT and other organochlorine pesticides were used extensively for spruce budworm and agricultural

Table 6. Active and historic¹ bald eagle territories of Penobscot Bay.

¹Historic sites are presently inactive, but have been active at some time since 1962, when the first bald eagle surveys were begun.

pest control. These pesticides caused reproductive failure in many birds of prey, and were banned from use in North America in 1972. Bald eagles and other birds of prey have since responded with improvements in their reproductive success. Because of slow decomposition rates in Maine's forest soils, DDT still adversely influences the production of some pairs.

Nevertheless, Maine's bald eagle population continues to produce more young each year. New breeding pairs of bald eagles in Maine have been found in recent years, and most often resume use of historic nest sites that were abandoned in the 1950's and 1960's.

Today, a tremendous increase in land development and recreation is occurring in mid and eastern coastal regions, and has already modified western coastal areas formerly occupied by nesting eagles. Habitat protection and management, particularly at the nest site, are essential to assisting the recovery of bald eagles in Maine.

Protective Legislation. Bald eagles are protected under the Bald Eagle Protection Act of 1940. Recently the law was strengthened, and is now known as the Eagle Protection Act, which prohibits anyone from "taking" any bald eagles, dead or alive, or any nest, egg, or parts of these birds. The Act defines "taking" as "to pursue, shoot, poison, wound, kill, capture, trap, collect, molest, or disturb."

A violation of the Eagle Protection Act can result in fines of \$10,000 to \$20,000 or imprisonment for one or two years, or both. Bald eagles are also protected under the Endangered Species Act and the Migratory Bird Treaty Act, both with restrictions and penalties similar to the Eagle Protection Act.

General Guidelines for Protection of Bald Eagle Nests.

Eagles have a prolonged nesting season during which they are extremely sensitive to disturbance. Any activities near the nesting territory may be harmful from the time adults arrive at a nest to the period when young eaglets disperse in late summer. General dates for this critical period are 1 February - 31 August in coastal Maine and 1 March - 30 September in interior Maine. The first 2 months of the nesting season (courtship, nest repair, egg-laying, incubation, and hatching) are especially critical, and disturbances may cause nesting failure or even abandonment. Adult

eagles may occupy nesting territories throughout the year, particularly in coastal regions.

Our protection recommendations consist of three concentric buffer zones which are less restrictive as the distance from the nest increases. This policy conforms with the protection suggested in national recovery plans for bald eagles. Suggested shoreland zoning districts are those defined by the Maine Shoreland Zoning Act of 1971 (Appendix I).

ZONE 1 - 0-330 feet from the nest should be maintained as an undisturbed nesting sanctuary. The natural habitat should not be modified at any time of the year unless such actions are deemed essential to site preservation by a consulting wildlife biologist. Recreational activities (hunting, fishing, hiking, boating) should not be permitted during the critical nesting period. All areas within this zone should be designated resource protection districts.

Prohibited activities year-round:

- Timber cutting without consultation with a wildlife biologist
- Land clearing without consultation with a wildlife biologist
- Road, trail, or building construction
- Repeated human visitation

Non-nesting period:

- Activities should be kept to a minimum, but the following activities are acceptable: hiking, fishing (recreational and commercial), farming (plowing, planting, and harvesting)

ZONE 2 - 330-660 feet from the nest should be limited to light land-use activities conducted only during the non-critical period. Areas used by eagles should be preserved in a natural state. Any timber harvests should not exceed 20% of the available stand volume in this zone. Stand openings created by cutting should be distributed evenly through the stand, and each should not exceed an area of 7,500 square feet. All areas within this zone should be designated a resource protection district.

Prohibited activities year-round:

- Clear cutting
- Land clearing (openings greater than 7,500 square feet)
- Building permanent structures, roads, or trails

During the critical nesting period:

- Human activity should be minimized
- Farming or commercial fishing is possible if wildlife biologists have found that nesting eagles are tolerant of these activities.

Non-nesting period:

- The following activities are acceptable: hunting, fishing, hiking, farming
- Selective thinning or maintenance of timber stands using the guidelines stated above
- Maintenance of existing roads or trails

ZONE 3 - 660-1,320 feet from the nest should exclude new construction of roads and buildings. Specific sites valuable to eagles (perching areas or potential nest trees) should be preserved, but there are no other land use restrictions for activities conducted during the noncritical period. All areas within this zone should be designated resource protection or limited recreational-residential.

Most activities are possible in this zone outside of the critical nesting season except construction of new buildings or roads. If construction is warranted, a wildlife biologist should be consulted. Buildings and roads should be out of the line of sight from the nest and conform to at least a 75 foot setback from the shoreline. The integrity of the shoreline vegetation should be maintained by limiting cutting along the shoreline to only those trees 4 inches or less in diameter within the mandated resource protection zone.

Other nest management guidelines

- 1) A supply of mature trees should be maintained in the area since eagles prefer old-growth trees to perch and build their nests. Tall white pines are the favored nest and perch trees for eagles in Maine.
- 2) Nearby shorelines offering perch trees are an important component of the nesting habitat and should be preserved in a natural state. These restrictions generally conform with local Shoreland Zoning ordinances.
- 3) Site enhancement measures (e.g. posting, provision of food to eagles, making snags available as perch trees, structural bracing of a nest in poor condition, and even building an artificial nest) are feasible and can be evaluated on a site by site basis.

- 4) Winter Habitat. Wintering bald eagles are more tolerant of human activity than nesting eagles. This minimizes land-use conflicts with wintering eagles and provides unique opportunities for coexistence and direct public enjoyment of bald eagles.
- 5) Historic Sites. Maine's coastal bald eagle population is presently expanding westward, recolonizing historic territories. Areas with documented use by nesting bald eagles since the first systematic eagle surveys began in 1962, should therefore be protected from major habitat alterations and large scale human development.

A town's goal should be to distribute development projects in a known eagle wintering area such that development does not affect the existing levels of eagle activity. The integrity of wooded shorelines should be preserved as limited recreational-residential districts. This policy applied to all shorelines with the mandated 75 foot resource protection zone provides uniform perching areas for eagles, widespread public viewing opportunities, and retains favorable scenic and aesthetic values. Specifically, any cutting in the 75 foot shoreland protection zone should be restricted to smaller trees (e.g. 4 inches or less in diameter) and large snags should be left along the shoreline for perch trees. In known communal roosting areas, an expanded 150 foot shoreline zone as a resource protection district is warranted.

MANAGEMENT GUIDELINES FOR OSPREY NEST SITES

Introduction. Ospreys or "fish hawks" are a common bird of prey in Maine, and have a wingspan of $4\frac{1}{2}$ to 6 feet. In flight, ospreys are distinguished from bald eagles by their white underparts, a dark patch at the sharp bend or "wrist" of the wings, and their habit of hovering before diving into the water to capture fish. They attain maturity at 3 years of age, at which time they choose a mate for life and begin building a large stick nest that they will return to each year. Osprey nests are typically near water, atop snags or live trees having dead, broken tops, but they occasionally nest on exposed rock ledges. Some ospreys are tolerant of human activity and build their nests on channel markers, utility poles and towers, and artificial platforms. A pair of ospreys may maintain 2 or 3 nests within their territory, selecting one to nest in each spring. At some sites in Maine, ospreys nest in colonies of 2 to 11 pairs. Ospreys feed almost exclusively on "rough" fish. In the fall, both adults and young migrate to Central and South America, going as far south as Argentina and Chile. The young birds remain in southern quarters until maturity, when they return to nest near their place of birth.

Status. The osprey population in Maine, as in many other regions of North America, is recovering from a dramatic decline. Like bald eagles, ospreys are extremely sensitive to environmental contaminants. Ospreys are still classified as endangered in 8 states and threatened in 20 others. However, because of their greater reproductive rates and higher tolerance of human activity, the osprey population in Maine has increased dramatically during the last decade. Survival of these birds depends increasingly on the species' ability to associate with humans. Suitable nesting habitat adjacent to foraging areas continues to be lost, and many birds are forced to adapt to man-altered habitats. As a result, public awareness of ospreys has increased in recent years, and entire communities are now participating in osprey management projects, including artificial nest programs and protection of natural nest sites.

Protective legislation. The osprey is protected by the Migratory Bird Treaty Act of 1918, and State of Maine Wildlife Laws which prohibit "possession, killing, transporting, selling, buying, or needlessly destroying the nest or eggs."

General Guidelines for Protection of Osprey Nesting and Feeding Areas

Nesting Areas. The strong recovery of osprey populations in most parts of Maine, the birds' versatility of nest site selection, and the large turnover rates of nest sites, somewhat diminishes the benefits of intensive site specific management. Instead, we propose a less ambitious program for all but locally depleted and colonial nesting populations. As a general rule, during the critical nesting period osprey nests should be protected by a 600 foot forested buffer from new road, trail, and building construction, logging activity, or repeated human disturbance. General dates for the critical nesting period are:

coastal Maine: April 1 to August 15
interior Maine: April 15 to August 15

The first 2 months of the nesting season (courtship, nest repair, egg laying, incubation, and hatching) are the most critical. Disturbances that cause an incubating or brooding bird to flush from the nest can cause nesting failure. Ospreys use a loud chirping call or will even attack when visitors venture too close to the nest. These behaviors should be sufficient warning to leave the nesting area. Signs warning the public to maintain respectable distances from nesting birds should be erected.

Buffer Zones. Our protection recommendations consist of a single buffer zone around a nest, or comprehensive habitat management for colonial groups of osprey nests. Osprey nest management guidelines are more stringent in other regions where ospreys are an endangered or threatened species. Suggested shoreland zoning districts are those defined by the Maine Shoreland Zoning Act of 1971 (Appendix V).

Single Osprey Nests. A forested buffer zone should be established 0-600 feet from the nest. During the critical nesting period, human activity should be minimized and should exclude new construction of major roads and buildings. Ospreys are variable in the amount of human disturbance they will tolerate. Generally, pairs that build nests in close proximity to buildings, roads, or on bridge piers, chimneys, channel markers, or utility poles have accepted human activity, and buffer guidelines may be modified after consulting with a wildlife biologist. All areas within this zone should be designated resource protection districts or limited recreational-residential.

Most activities are possible in this zone outside of the critical nesting season except construction of major roads and buildings. If construction is warranted, a wildlife biologist should be consulted. Buildings and roads within the zone and adjacent areas should be out of the line of sight from the nest and conform to a 75 foot or greater setback from the shoreline. The integrity of the shoreline vegetation should be maintained by limiting cutting along the shoreline protection zone to only those trees 4 inches or less in diameter.

Selective cutting within the 600 foot buffer zone is acceptable outside of the critical nesting period, but harvest should be limited to 40% of the stand volume. A special effort should be made to preserve snags and clumps of tall trees for alternate nest sites.

Prohibited activities year-round:

- Clear cutting
- Building permanent structures and major roads
(see comments above concerning ospreys accepting human activity)

During the critical nesting period:

- Human activity should be minimized
- Farming or commercial fishing is possible if wildlife biologists have found that nesting ospreys are tolerant of these activities

During the non-nesting period the following activities are acceptable:

- Hunting, fishing, hiking, farming
- Selective thinning of forest stands up to 40% of stand volume
- Maintenance of existing roads or trails

Colonial Nesting Areas. Colonial groupings of osprey nests (more than 1 pair per 200 acres) should be buffered collectively. The guidelines delineated above should be applied to each individual nest, the colony boundaries should be delineated by a wildlife biologist, and the integrity of the 250 foot shoreline zone should be maintained. Colonial nesting ospreys are rare in Maine and indicate the proximity of a unique, highly productive feeding area or a severe shortage of suitable nesting habitat. All colonies should be delineated as resource protection districts. Prohibited and acceptable activities are the same as those for single osprey nests.

Other osprey management guidelines:

- 1) A supply of mature trees and snags should be maintained along the shoreline for potential nest sites. Tall white pines and broken-topped spruces are favored nest and perch trees for ospreys in Maine.
- 2) Maintaining the integrity of wooded shorelines greatly enhances osprey nesting and perching habitat. Minimum setbacks of 75 feet or greater for building or road construction along a wooded shoreline not only complies with shoreland zoning ordinances but lessens the influence of new construction on ospreys, eagles and other wildlife.
- 3) In addition to maintaining a shoreland buffer, forestry operations within 1200 feet of the shoreline should adopt provisions to preserve large snags and leave isolated clumps of tall over-mature trees of low merchantable value. Ospreys and eagles will often nest in these residual trees.
- 4) Community artificial nest platform programs have been successful for ospreys. Artificial platforms can be used to provide a nest site in areas that lack sufficient natural sites, replace insecure natural nests, relocate nests away from excessive disturbance, and substitute nests located on hazardous or conflicting man-made structures. The design and placement of nest platforms should be under the direction of wildlife personnel.

Feeding Areas. The restoration and enhancement of fish populations, especially anadromous runs of alewives and shad, and rough fish such as suckers and bullhead, will greatly benefit ospreys, eagles, herons and a host of other wildlife. Working fish ladders should be constructed and maintained at dam sites. Environmental contaminants, especially substances known to impair the reproduction of ospreys and eagles (such as organochlorine pesticides, PCB's, mercury and lead) should not be introduced into the environment, especially near known feeding or nesting areas.

Ospreys are a high profile wildlife species and have generated tremendous public interest and awareness. Their recent population increase in Maine is an indicator of the health and well-being of their natural environment. Conversely, a decrease in a town's osprey population is an indicator of

environmental degradation. It should be a town's goal to maintain or increase their osprey population (Table 7). Because this species is more adaptable to man's activities, a variety of less stringent management options are available. Nevertheless, only careful municipal planning today will ensure a healthy population of ospreys in the future.

To answer any questions about proposed activity in the vicinity of an osprey feeding or nesting area, contact the MDIFW regional wildlife biologist.

MANAGEMENT GUIDELINES FOR COLONIAL NESTING SEABIRD ISLANDS

Introduction. Between three and four thousand islands and exposed ledges comprise the Maine archipelago. Three hundred and fifty of these are of special significance because they are used as traditional sites by twenty species of colonial-nesting seabirds.

Many of these birds are at the northern or southern limit of their range, and for several (common eider, black guillemot, Atlantic puffin, razorbill auk, great cormorant, Leach's storm petrel), Maine is the only one of the contiguous 48 states with breeding populations.

Status. Populations of colonial nesting seabirds throughout Maine were decimated by the late 1800's from overharvest for meat, eggs, and feathers. The growing list of vanishing species sparked national interest, and was the issue of concern which prompted formation of the National Audubon Society, and led to the drafting and promulgation of the Migratory Bird Treaty Act of 1918.

Those birds which survived the excessive exploitation of the 19th century responded well to the protective legislation, which coincided with the collapse of many island-based economies. Numerous island communities were abandoned, allowing historic seabird islands to be recolonized by their former residents. It is of the utmost importance to understand that both the protective legislation and the off-island emigration of people were requisite to the rapid recovery of many species we have observed during the past six decades. Had 19th century levels of human disturbance and occupation of breeding habitat been maintained, existing legislation would have been inadequate in providing the "climate" required for this recovery.

The recent explosion of development along the coast is threatening to reverse the recovery trend through the escalating demands on islands for recreation and homesites. To maintain Maine's populations of colonial nesting seabirds, these nesting islands must be made available to the birds in an undeveloped and undisturbed state.

Penobscot Bay supports more than 26,000 pairs of nesting marine birds on 123 islands and ledges (Tables 8 and 9). Many of the seabird islands are already protected from development through acquisition or easement by state agencies and conservation organizations, and are posted with

Table 8. Nesting marine birds of Penobscot Bay.

Common Name	Scientific Name	Colonies	Nesting Pairs
Leach's storm petrel	<u>Oceanodroma leucorhoa</u>	7	941
Great cormorant	<u>Phalacrocorax carbo</u>	5	62
Double-crested cormorant	<u>Phalacrocorax auritus</u>	47	5,043
Great blue heron	<u>Ardea herodias</u>	3	71
Canada goose	<u>Branta canadensis</u>	4	4
Common eider	<u>Somateria mollissima</u>	89	8,890
Bald eagle	<u>Haliaeetus leucocephalus</u>	10	10
Osprey	<u>Pandion haliaetus</u>	69	110
Great black-backed gull	<u>Larus marinus</u>	83	2,831
Herring gull	<u>Larus argentatus</u>	73	5,804
Laughing gull	<u>Larus atricilla</u>	2	48
Terns ¹	<u>Sterna spp.</u>	17	1,016
Razorbill	<u>Alca torda</u>	1	15
Black guillemot	<u>Cepphus grylle</u>	53	1,918
Common puffin	<u>Fratercula arctica</u>	1	125
Total			26,887

¹ Includes Common terns (Sterna hirundo) and Arctic terns (Sterna paradisaea).

signs describing permitted activities and periods of use. The most important nesting islands under LURC jurisdiction have been zoned as resource protection areas. Development on islands remaining in private hands is regulated by municipal zoning ordinances, state environmental laws and the goodwill of the owners.

Protective Legislation. The Migratory Bird Treaty Act of 1918, and State of Maine Wildlife Laws provide limited protection through the regulation of harvest, and prohibition of harassment outside designated hunting seasons, including needless destruction of nests or eggs.

Management Guidelines

Colonial-nesting marine birds are extremely vulnerable to the effects of human disturbance during the nesting season, which extends from 1 April through 15 August for most species. Disruption of nesting birds at this critical time can result in excessive mortality of chicks and eggs from predation and exposure. During this period, all human use of the islands should be prohibited. Activities around the islands should be conducted far enough off shore to prevent flushing birds from the nest, or approximately 1/4 mile.

Development or building should not be allowed on seabird nesting islands, except in very rare cases where the nesting colony is located in a relatively small area of a large island, and adequate visual buffers can be maintained to prevent disturbance. Limited construction may be permitted only after review and approval by a wildlife biologist.

All seabird nesting islands should be posted with signs identifying the island as a nesting sanctuary, and explaining prohibited activities and periods of use. Boaters should be able to interpret signs at 200 feet from the shore. Periods of restricted use may vary somewhat from the 1 April to 15 August guidelines for islands with late-nesting species such as Leach's storm petrels, black guillemots and terns. Prohibited activities will also vary depending on the nesting species. Guidelines for human use of any seabird nesting island should be developed by the appropriate MDIFW biologist, and implemented through cooperative agreements with private land owners and state agencies having ownership of, or jurisdiction over, seabird islands. In general, low intensity recreational use, such as picnicking and hiking can be permitted outside the nesting season. The building of fires should be prohibited at all times.

All seabird nesting islands in Penobscot Bay (Table 9) should be zoned resource protection districts, and MDIFW recommendations should be incorporated into the land-use guidelines for these districts. Variances should not be granted without review and approval of the application by MDIFW personnel.

MANAGEMENT GUIDELINES FOR COASTAL GREAT BLUE HERON COLONIES

Introduction. The stately great blue herons are the largest and most well-known of Maine's wading birds. Returning to the state in March or April from their more southerly wintering grounds, adult herons reclaim nests from the previous year in colonies ranging in size from two to over two hundred nesting pairs. During the nesting season (approximately 1 April through 15 August) nests are repaired or built anew, and clutches of usually 3-4 eggs are laid and incubated until the young hatch in late May or early June. Young are fed on the nest until they fledge in July or August, at which time the birds abandon the nesting colony and disperse to coastal and inland feeding areas. Fall migration extends into November, with an occasional bird or two remaining in coastal areas during mild winters.

Coastal nesting colonies are typically located on islands or peninsulas remote from human disturbance, and are often several miles from feeding areas. Nests are built of sticks near the tops of either softwood or hardwood trees, and are typically re-used from year to year until the nest tree dies and blows down, or the colony abandons the site.

The two most important factors governing the continued presence of both inland and coastal nesting great blue herons in Maine are the availability and abundance of undisturbed nesting habitat and undisturbed, uncontaminated feeding areas. Human disturbance of a nesting colony can cause: 1) abandonment of the entire colony; 2) mortality of eggs and young on the nest from predation (gulls, ravens, eagles) and exposure; and 3) starvation and predation of young that leave the nest before they are able to fly (adults will not feed young on the ground).

Great blue herons feed on a variety of fresh and salt water organisms. Small fish and marine invertebrates are captured in tidal pools and creeks. Frogs, small fish, and the larger freshwater invertebrates are taken in shallow freshwater habitats. Because many of its prey concentrate chemicals from the water column and bottom sediments, the great blue heron is extremely vulnerable to the cumulative effects of pollutants entering the water from residential, industrial and agricultural sources. In many states, pollution of feeding areas from agricultural run-off and other sources has reduced populations to the point of extirpation.

Status. Maine has the only coastal nesting population of great blue herons in New England, and the largest population north of Virginia (Korschgen 1979). Twenty island colonies, with 1,208 active nests, were located along the Maine coast in 1983 (Gibbs and Woodward, 1984). At that time, Penobscot Bay included 7 of these colonies, with 200 nesting pairs, representing 17% of Maine's coastal nesting population. Three of these colonies have been abandoned since the 1983 survey, one as the result of human disturbance (cutting of trees), two for unknown reasons. A new colony was discovered in 1984. The present nesting population for the region is 131 pairs in 5 colonies (Table 10). Three of these colonies are located on small islands, one is on a small peninsula on a large island, and one is on a large mainland peninsula.

Protective Legislation. Great blue herons are protected by the Federal Migratory Bird Treaty Act and State of Maine Wildlife Laws, which prohibit "possessing, killing, transporting, selling, buying, or needlessly destroying the nest or eggs".

Management Guidelines

Nesting Colonies. Guidelines for activities around heron colonies are the same for both coastal and inland sites, and follow closely the guidelines for bald eagles.

Hérons are sensitive to disturbance from the time adults arrive at the colony, until the young fledge. General dates for the nesting period in coastal Maine are: 1 April through 15 August. The first 2 months of this season are devoted to courtship, nest repair, egg-laying, and incubation, and are an especially sensitive period. Disturbance within or adjacent to the colony during this time can cause individual nest failures or abandonment of the entire colony.

Management recommendations around a heron colony consist of two concentric buffer zones around the colony proper (Zone 1):

ZONE 1 - is the nesting colony proper, and is delineated by the outer-most nest trees of the colony. Human activity is prohibited in this area during the above-defined nesting season. Alteration of the existing natural habitat is prohibited at all times unless deemed beneficial to the preservation of the colony by a professional wildlife biologist. The colony area should be incorporated in a resource protection district.

Area No.	Location	Town	Nesting Pairs
-	Fresh Pond ¹	Brooksville	6
P044	Philbrook Cove	Islesboro	54
P001	Graffam Island	Muscle Ridge	25
P130	Scraggy Island	Stonington	40
P157	Sheep Island	Stonington	6

¹This colony, which is in the interior of Cape Rosier, is not included in a designated wildlife area.

ZONE 2 - (300-600 feet from the perimeter of the colony). Activities permitted in this zone are the same as those permitted for buffer zone 2 under the Bald Eagle Management Guidelines.

ZONE 3 - (660-1,320 feet from the colony perimeter). Activity and land use restrictions are the same as those outlined for buffer zone 3 of the Bald Eagle Management Guidelines.

Deviations from these guidelines should not be permitted without review and consent by a professional wildlife biologist.

These buffer zones are the minimum level of protection that should be provided to heronries. Because the effects of human disturbance to a colony depend on factors including stage of the nesting cycle, habituation to human activity, size of colony and type of habitat surrounding the colony, any major developments proposed within one mile of a heronry should be reviewed by a wildlife biologist to assess potential effects to the colony and to recommend appropriate buffer zones and timing of activities.

MANAGEMENT GUIDELINES FOR SHOREBIRD FEEDING AND ROOSTING AREAS

Introduction. Shorebirds are a closely related group of species that are represented in Maine by the sandpipers, plovers, turnstones, curlews, dowitchers, and phalaropes. The Maine coast is most important as a feeding and resting area for over 25 species of migratory shorebirds. Six species, including the endangered piping plover, breed along the coast, and one species, the purple sandpiper, is a winter resident.

Shorebirds should receive special management consideration because large numbers of these birds depend on coastal habitats in Maine for feeding and resting during their long migration from the Arctic breeding grounds to South American wintering areas. During their brief stay in Maine, most shorebirds feed intensively on intertidal invertebrates and nearly double their weight in fat reserves. This fat is used as fuel for the nonstop 2,600 mile transoceanic flight. Although migratory shorebirds are observed briefly in Maine (from July to September), the coastal habitats they use are critical to the continued success of their annual migrations.

Status. Shorebird populations are still recovering from tremendous population declines incurred in the late 1800's and early 1900's resulting from market hunting. Several species including the Eskimo curlew, golden plover, and whimbrel are still rare today. However, the continued recovery of all shorebird species depends particularly on conservation of fall migration areas (Maine and the Bay of Fundy region), wintering quarters (coastal South America) and spring migration stopovers (central U. S. and Canada). Today, habitat loss and degradation are a major threat to shorebird populations. The piping plover, which nests in southern Maine, was recently placed on the Endangered Species List because of habitat loss and problems associated with human disturbance near nest sites.

Protective Legislation. In 1900, the Lacey Act prevented the interstate transfer of birds and effectively stopped the exportation of shorebirds shot in Maine to markets in Boston and New York City. Now, all shorebirds are fully protected under the Migratory Bird Treaty Act. The piping plover is also protected by the federal Endangered Species Act and the Maine Endangered Species Act.

General Guidelines for Protection of Shorebird Feeding and Roosting Areas

The continued importance of the Maine coast to migrating shorebirds depends on the conservation of their feeding and roosting habitats. Commonly used feeding areas include mudflats, salt marshes, sand and gravel beaches, mussel bars, blueberry fields, and bogs. Major roosting habitats are gravel and sand beaches and bars, salt marshes, rocky ledges, fields, and pastures. Each species has preferred feeding and roosting habitats. The importance of a region to a particular species depends on the abundance of its preferred habitats in that region. In general, conservation of intertidal mud and sand flats, sand beaches and gravel bars would provide feeding and resting areas for a diversity of shorebird species.

The greatest numbers of shorebirds migrate through Maine between 10 July and 10 September. For most species, adult shorebirds leave the arctic breeding grounds before the young can fly, and juvenile birds follow three to four weeks later. Purple sandpipers are the only species that winter in Maine in substantial numbers.

Feeding Areas. Protection recommendations consist of applying the existing shoreland zoning districts (Maine Shoreland Zoning Act of 1971) to protect the most important shorebird feeding areas in Penobscot Bay (Table 11). In addition, activities should be restricted that would substantially alter the integrity of the existing shoreline or influence the abundance or species composition of the intertidal invertebrate populations that the shorebirds utilize for food (eg. dredging, filling, construction of piers, jetties, seawalls, discharge of human and industrial waste.) Shorebirds may shift to other feeding areas if excessive alterations or destruction of intertidal habitats occur. However, it should be a town's goal to protect and enhance it's existing shorebird feeding areas through wise land-use practices and informational posting of important sites during the period of peak use (see below).

Shorebird feeding areas should be zoned resource protection or limited recreational-residential. In residential or urban areas, the integrity of the existing shoreline should be maintained. Human activity should be discouraged from 10 July to 10 September, during peak migration. Activities that would diminish the intertidal invertebrate diversity or abundance should be prohibited year-round.

During the peak migration period (10 July to 10 September):

- Human activity should be regulated (particularly in Class A and B wildlife areas)
- Light to moderate intensity clam or worm digging, commercial fishing (except dragging), and recreation are permitted.

Prohibited activities year-round:

- Overboard discharge of sewage or other environmental contaminants on or near mud or sand flats used by shorebirds.
- Activities such as dredging or filling on feeding areas, or dragging within 1/2 mile of mean low tide of feeding areas that would cause deposition of sediment should be prohibited, especially in Class A and B wildlife areas.

Most activities are possible in shorebird feeding areas outside of the migratory period, except dredging, filling, or dragging. Building and road construction, forestry and agricultural activities should be out of the line of sight from the feeding area and conform to at least a 75 foot or greater setback from the shoreline.

Roosting Areas. Roosting habitats are extremely limited and are highly traditional. The physical characteristics of a roost site offer shorebirds protection from adverse weather and predators, in addition to a place to rest at high tide. Good roost sites are limited and shorebirds will travel for miles to a well-protected roost at high tide. Many roosting areas have been used by shorebirds since colonial times. The loss of these areas would severely decrease the number of shorebirds that successfully migrate through Maine.

All shorebird roosting areas and the adjacent shoreline within 300 feet of each roosting area should be classified resource protection districts and maintained as sanctuaries. The natural habitat should not be modified at any time of the year unless such actions are deemed essential to site preservation after consulting with a wildlife biologist. Recreational activities (hunting, fishing, hiking, boating) should not be permitted during the migratory period. Within this 300 foot protection zone:

Prohibited activities year-round:

- Land clearing without consultation with a wildlife biologist.
- Road, trail, or new building construction.

During the migratory period:

- Human activities should be minimized. Posting of the area may be warranted.

During the non-migratory period:

- Hunting, fishing, hiking, commercial fishing, and farming are acceptable.
- Selective thinning or maintenance of timber stands within the 300 foot zone is acceptable.

MANAGEMENT GUIDELINES FOR EIDER MOLTING AREAS

Introduction and Status

Maine is the only one of the contiguous 48 states supporting a breeding population of the Common eider (Somateria mollissima), with more than 22,000 pairs nesting on 240 islands along the coast of Maine (Korschgen 1979). Penobscot Bay supports an estimated 8,805 pairs on 89 islands, representing 40% of the State's breeding population (Tables 8 and 9).

Once incubation by the females is underway, drakes (male birds) migrate to traditional sites in late June and July to undergo a complete wing molt. Females delay molting until their young have hatched and moved off the nesting islands to shoal-water brood-rearing areas, where the chicks of several hens (female eiders) combine into creches (flocks of chicks from several females).

During this molting period, which lasts approximately one month, the adult birds congregate in large flocks (more than 10,000 birds have been observed at some sites). All the primary flight feathers are lost simultaneously, leaving the birds flightless for a period of approximately three weeks. Because eiders use their wings to propel themselves underwater, they may be unable to feed during some portion of the flightless period. However, birds may feed heavily at these sites prior to the molt, in order to build up the protein and fat reserves required for body maintenance and replacement of feather tissue. High energetic demands are therefore being made at a time when birds are least able to replenish these reserves. Because the molting eiders cannot fly, they are exceptionally vulnerable to both avian and aquatic predators. This may explain why the birds congregate into large flocks - ie. "safety in numbers" reduces the chances of any individual being taken by a predator.

Eider molting sites in Maine are important not only to our own birds, but to the Canadian Maritime population, as well. The numbers of molting eiders observed along Maine's coast during the late summer and early fall (Hutchinson, personal communication) suggest that Canadian birds, probably from Nova Scotia and New Brunswick, are migrating to Maine for their molt. This migration allows males to remove themselves from areas where they would otherwise compete with females and chicks for food. Many of these sites are also important concentration areas for large wintering flocks of eiders.

The primary threats to molting eiders from human activities are: 1) disturbance of flocks by boaters; 2) depletion of their food resource through intensive harvesting for blue mussels (the eider's primary food); and 3) oil spills.

Boating activity in proximity to molting flocks causes disturbed birds to expend energy required for the molting process. For females, whose energy reserves are already severely depleted by the demands of recent egg-laying and incubation (Korschgen 1976), the additional stresses of attempting to flee disturbance may contribute to the death of birds from starvation.

Because flightless birds concentrate in large flocks during the molt, an oil spill in the vicinity of a major molting area could threaten a significant portion of Maine's breeding population.

The following recommendations for protection of eider molting areas are admittedly general in nature. As we learn more about the specific habitat requirements of molting eiders, and as human activity and demands for exploitation of marine resources increase, more specific guidelines will be developed. The locations of eider molting areas are identified on the town maps.

Protective Legislation. The Migratory Bird Treaty Act of 1918, and State of Maine Wildlife Laws provide limited protection through the regulation of harvest, and prohibition of harassment outside designated hunting seasons, including needless destruction of nests or eggs.

General guidelines for the conservation of molting eider sites.

Any human activities which would cause repeated disturbance of molting eider flocks should be prohibited. Such activities include, but are not limited to, intensive recreational boating traffic, and harvesting and mining of marine resources.

Activities within 1/4 mile of a designated eider molting area should not alter the existing biological community structure and function. Indigenous species populations should be maintained at existing levels.

Shipping lanes for the transport of petroleum products and other toxic materials should be located at a distance sufficient to ensure negligible chances for adverse impacts to nearby molting areas in the advent of a spill.

MANAGEMENT GUIDELINES FOR SEAL HAUL-OUTS

Introduction

Maine has the largest population of harbor seals (Phoca vitulina) of any Atlantic state, and supports the only significant breeding population in the eastern United States. Gray seals (Halichoerus grypus), which are much larger than the harbor seal, are uncommon but regular visitors to Maine's coast, and usually found around remote offshore ledges and islands. The gray seal does not breed in Maine, and although pups are occasionally seen, they have probably dispersed from their birthplaces around Sable Island or the Gulf of St. Lawrence in eastern Canada.

Populations of both species were severely depleted by overharvesting through the middle part of this century, but have increased dramatically during the past twenty years in response to protective legislation.

Protective Legislation

All seals are protected by the Marine Mammal Protection Act of 1972, and State of Maine Wildlife Laws, which recognize the aesthetic and economic value of seals. Under these laws it is prohibited to harass, take, import, possess, transport, sell, or offer for sale unlawfully taken seals.

Status

Maine's population of harbor seals has more than doubled since 1973, to an estimated 13,000 plus animals in 1986 (Gilbert and Stein, 1981; Wynne, personal communication). Seventeen hundred pups were sighted in 1986 (Wynne, personal communication), of which approximately 25% were born on traditionally used islands and ledges in Penobscot Bay. Estimates of Maine's gray seal population are not reliable. Only a handful were sighted during this study.

All seals use half-tide ledges and island beaches for resting and whelping, and these sites are necessary for the survival of both adults and young. Whelping or "pupping" sites are used from year to year by the same breeding females, many of which were probably born on these same ledges (Cowperthwaite, unpubl. data). These specific sites are important because of their proximity to high quality feeding areas, combined with a lack of human disturbance.

The attributes of food availability and lack of disturbance also determine selection of haul-out ledges by nonbreeding and post-breeding seals (Ronald, Selley and Heally, 1982). Adult seals undergo a complete pelage molt in mid to late summer. This is a physiological stressful period demanding additional rest to sustain the increased metabolic activity associated with skin and fur replacement.

Guidelines for Protection of Seal Haul-outs

Human disturbance and contamination from oil spills are the primary threats to seals at haul-outs. Curious boaters approaching too close to hauled-out seals, or actually landing on the islands and ledges, will force seals to flee into the water. Young pups can easily become permanently separated from their mothers, resulting in a slow death by starvation. Pups are born without a thick layer of blubber, and must rely on solar energy for thermoregulation during the first few weeks of life. Until pups have acquired a layer of blubber, long periods of immersion in Maine's cold coastal waters can cause death from hypothermia. Curious pups are also slow to avoid boats, and are therefore vulnerable to injuries from boat propellers.

The hazards to marine mammals from oil spills are well-documented. Ingestion of petroleum products, and oiling of fur can cause death. Spills in proximity to major pupping areas could be especially disastrous, affecting hundreds of seals.

Our recommendations for protection of seal haul-outs focus on minimizing both exposure to human disturbance and the potential for involvement with major oil spills.

Informational signs should be posted at major boat launching areas and marinas explaining the problems of human disturbance to seals, and requesting that boaters avoid harassment by remaining at least 200 ft. from all seals, whether hauled-out or in the water. Wildlife tour boats should be required to observe the NOAA guidelines for distances to be maintained from marine mammals.

Siting of major marinas and oil tanker shipping lanes should avoid important haul-out areas.

The location of seal haul-outs are indicated on the town maps.

Recommendations for Integrating Wildlife Values Into Coastal Resource Planning and Development.

Conservation of Penobscot Bay's wildlife depends on the judicious allocation of diverse coastal resources to minimize the negative effects of human development and use.

Following are several recommendations for using the habitat classifications and guidelines for Class A, B, and C areas, and the management guidelines for Special Wildlife Features to guide both the development and protection of the coastal resources which support Penobscot Bay's abundant wildlife.

Land-use planning and development

Site location

The prioritized, site-specific information on significant coastal wildlife habitats provided in this report should be incorporated into the site-location permit review process required by the Site Location and Development Act:

- to determine if the proposed activity is compatible with the recommended conservation guidelines for use of the area.
- to propose and/or evaluate alternate site locations based on the relative significance of each site to coastal wildlife.
- to make recommendations for mitigation of unavoidable development-related reductions in the wildlife value of a site, and for compensation through in-kind protection of coastal wildlife concentration areas supporting a similar species composition and abundance in the same geographic region.

Shoreland and Municipal Zoning and Planning

The ranking of wildlife areas and specific recommendations for protecting highest-priority sites included in this report will serve to guide towns in the allocation of coastal resources through land-use zoning. Towns containing all or part of a Class A area should be required to develop and implement specific strategies (not limited to zoning) for conservation of the sites within their comprehensive town plans. Minimum protection levels should be those outlined under the

management guidelines for Class A areas. For sites/towns with multiple special wildlife features, the most conservative buffer zones and human use restrictions should be implemented. All requests for development permits or the granting of variances within the recommended protection zones around Class A and B sites and special wildlife features should be reviewed by the Department of Inland Fisheries and Wildlife.

Coastal Public Recreation and Access

Evaluation of proposed sites for coastal public recreation and access should incorporate the preceding information on important coastal wildlife areas and the recommendations for permitted human activities within these zones.

For many of these sites, recreational activities are compatible with conserving the wildlife value of the area. The presence of wildlife usually enhances the value of an area for public recreation, and for appropriate sites, can provide an opportunity for public education about wildlife and other coastal resources.

Prioritizing sites for protection by public and private conservation organizations.

This is perhaps the most obvious application of the information contained in this report. Identification of the relative statewide, regional, or local importance of sites to individual species on a seasonal basis, as well as the composite ranking of areas, allows conservation organizations to focus acquisition and other protection efforts on the most valuable wildlife areas (i.e. Classes A and B). This expedites efficient use of limited manpower and funds to provide maximum levels of protection.

Marine Resource Planning

Aquaculture site location

Aquaculture of a variety of marine species is expanding along the Maine coast, and demand for sites is expected to escalate rapidly during the coming decade. The relationships between aquaculture activities and marine bird and seal use of an area have not been adequately addressed in Maine. Information from other states and

countries where aquaculture is well-established indicates that some animals may benefit from certain types of aquaculture operations. However, increased human disturbance, alteration of the original habitat, and "crop" depredation by wildlife make other aquaculture activities incompatible with existing wildlife use of an area. The wildlife concentration areas identified in this report should help identify potential wildlife conflicts at proposed aquaculture sites.

Current criteria for granting of aquaculture lease sites do not adequately address potential and predicted conflicts with marine birds and seals. As a first step towards incorporating conservation of these animals into marine resource allocation plans, MDIFW should be involved in the permit review process for aquaculture sites. Permits for aquaculture leases in Class A and B areas should not be granted without MDIFW approval.

Research must be initiated to evaluate the effects of various aquaculture activities on marine systems and the coastal wildlife the support. Only then can specific management strategies be developed and implemented to resolve conflicts.

Prioritizing areas for comprehensive marine resource conservation and management.

The Class A and B coastal wildlife areas identified in this report are, for the most part, shoal-water areas of high invertebrate productivity. While it has not been scientifically analyzed, it is probable that the distribution of those areas supporting the largest populations of marine birds correlates well with the value of these areas to commercial fisheries resources. This value may be related directly through the presence of commercially harvestable fin and shellfish, or indirectly through the importance of these sites as nursery areas for commercial species and production areas for other organisms in the food web of commercial species.

Evaluating and ranking marine fisheries production areas, and overlaying these on ranked coastal wildlife areas, will help clarify the location and overall ecological importance of specific coastal habitats.

Those sites which are identified as the most ecologically productive should be protected through inclusion in a coastal biological reserve system. Multiple use of these areas need not be excluded, but long-term conservation and management of biological resources should not be compromised by any proposed or ongoing activity.

Oil spill contingency planning, and siting of petroleum storage and transport facilities.

The ranking procedures used in this report were originally developed, in part, to identify important wildlife habitats for incorporation into oil-spill contingency planning. For a complete discussion of this application for ranked coastal wildlife information, the reader is referred to the Casco Bay Coastal Resources Inventory, 1981, published by the Department of Environmental Protection.

Knowledge of the location of habitats of greatest significance for coastal wildlife, and the seasonal distribution and abundance of species within and among these sites, enables oil spill response teams to direct their efforts towards these highest priority areas, thereby reducing the losses to wildlife in the event of a spill.

Petroleum storage and transport facilities, and traffic lanes for oil tankers should not be expanded in Penobscot Bay because of the state and national significance of the region for marine wildlife. Traffic lanes should avoid Class A, B, or C areas as much as possible, particularly those supporting marine bird nesting islands, molting eider flocks, and major seal haul-outs.

The eleven core laws of Maine's Coastal Program govern human activities in the coastal zone (Appendix I) and provide a mechanism through which the guidelines for conserving Penobscot Bay's marine wildlife habitats can be implemented. However, regulation alone is inadequate for long-term conservation of Penobscot Bay's marine wildlife habitats and the species they support. Certain particularly unique or vulnerable areas will require absolute protection from human development activities and general disturbance. This will require unprecedented levels of commitment, cooperation, and compromise by local residents, state agencies and private conservation organizations.

The Penobscot Bay Conservation Plan is but one small part of this initiative for conservation of Maine's wildlife heritage. Through this plan, the Department of Inland Fisheries and Wildlife has provided information which we hope will be integrated into existing programs and policies for natural resource conservation, and which will promote the development of new programs and policies, both at the local and state levels, to improve the ability of Maine's citizens to protect their wildlife heritage.

The Penobscot Bay Plan is a pilot project, and the authors encourage constructive comment and criticism by all interested individuals. All comments should be directed to the authors at the following address:

REGULATIONS GOVERNING HUMAN ACTIVITIES IN THE BIOLOGICAL SYSTEMS OF COASTAL MAINE (Adapted from Fefer, S. I. and P. A. Shettig (Eds.) 1980. An Ecological Characterization of Coastal Maine. Off. Biol. Serv., U.S. Fish Wildl. Serv., Newton Corner, MA.).

The regulations governing freshwater, (palustrine, lacustrine, and riverine systems), tidal (marine, estuarine, and riverine systems) and terrestrial habitats are summarized below.

In addition to those pertaining to habitats, numerous regulations exist concerning native species and their habitats (e.g., the Endangered Species Act, Migratory Bird Conservation Act, and Marine Mammal Protection Act).

Regulations Pertaining to Palustrine, Lacustrine, and Riverine Systems

In Maine, limited direct Federal and State controls exist over palustrine, lacustrine, and riverine systems. The federal agencies with direct regulatory authority over Maine's freshwater aquatic habitats are the Environmental Protection Agency (EPA) and the U.S. Army Corps of Engineers (COE). The EPA controls discharge of pollutants in all waters and wetlands of the United States. The EPA can rescind a State program. Any activities involving the discharge of dredged or fill material in United States waters, including all adjacent wetlands, are under the permit authority of the COE.

Although it has no direct regulatory authority, the U.S. Fish and Wildlife Service (FWS) plays an important advisory role in the issuing of permits by the COE and EPA. Under the Fish and Wildlife Coordination Act, the FWS assesses the impacts on fish and wildlife of all water and water-related land resource development projects that are funded by the Federal Government or are constructed under a Federal permit or license. Federal permits for water-related development are reviewed by the FWS to encourage avoidance of adverse impacts on fish and wildlife and their habitat, particularly wetlands. Also, under the Migratory Bird Conservation Program and the Land and Water Conservation Program, the FWS can acquire habitat (significant migratory waterfowl habitat, habitat for endangered species, important wildlife areas, and recreational and wilderness areas) that may include wetlands and other habitats. These acquisitions become part of the National Wildlife Refuge System.

Table 1. State Laws and Administrative Agencies Regulating Use of Coastal Maine Habitats.

System and law	Administrative agency ^a
<u>Palustrine, Lacustrine, and Riverine</u>	
Protection and Improvement of Waters	DEP
Site Location of Development Act	DEP and LURC
Solid Waste Management Act	DEP
Oil Discharge Prevention and Pollution Control Act	DEP
Stream Alteration Act	DEP ^b
Mandatory Shoreland Zoning Act	DEP ^b
Subdivision Law	MPB and LURC
Land Use Regulation Law	LURC
Great Ponds Act	DEP
<u>Estuarine and Marine</u>	
Site Location of Development Act	DEP
Coastal Wetlands Act	DEP and LURC
Mandatory Shoreland Zoning Act	DEP
Protection and Improvement of Waters	DEP
Oil Discharge Prevention and Pollution Control Act	DEP
Marine Resources Management Law	DMR
Land Use Regulation Law	LURC
<u>Terrestrial</u>	
Mandatory Shoreland Zoning Act	DEP
Subdivision Law	MPB and LURC
Site Location of Development Act	DEP
Solid Waste Management Law	DEP
Land Use Regulation Law	LURC
Protection and Improvement of Air Law	DEP

^aDEP = Department of Environmental Protection; DIFW = Department of Inland Fisheries and Wildlife; MPB = Municipal Planning Board; LURC = Land Use Regulation Commission; and DMR = Department of Marine Resources.

^bIn 1986, administrative authority for the Mandatory Shoreland Zoning Act was transferred from the State Planning Office to the Department of Environmental Protection.

Other Federal agencies that play an indirect role in the regulation of freshwater habitats in coastal Maine are the U.S. Forest Service (research and management in relation to forest practices), Soil Conservation Service (technical assistance programs in relation to resource conservation), National Park Service (acquisition and management), and U.S. Geological Survey (research). In addition, Executive Orders 11988 (Floodplain Management) and 11990 (Protection of Wetlands) require each agency to take steps to minimize impacts on, restore, and preserve floodplain and wetland areas.

On the State level, 11 laws exist to manage coastal resources by guiding development and by conserving natural resources declared by the State municipalities to be in need of protection. Of the 11 laws, eight pertain to freshwater aquatic systems in organized townships and one pertains to these systems in unorganized townships. The laws regulate uses of lakes, rivers, streams, brooks, and wetlands adjacent to these habitats. Great ponds (lakes) as defined by the State include natural lakes larger than 10 acres (4 ha) and artificial lakes larger than 30 acres (12 ha) and owned by two or more parties. This legislation does not cover a significant number and acreage of small wetlands that do not drain or connect with lakes or streams.

The Department of Environmental Protection (DEP) administers five of the seven laws. These include: Protection and Improvement of Waters, Site Location of Development Act, Solid Waste Management Act, Oil Discharge and Prevention Control Act and the Mandatory Shoreland Zoning Act. Under Protection and Improvement of Waters, the DEP has licensing authority over all discharges of waste waters into Maine waters (this includes all aquatic systems except those that are confined and retained completely upon the property of one party and do not drain into or connect with any other waters of the State). Besides being licensed, any discharge must receive "best practicable treatment" and must not lower the quality of any classified body of water below its classification level or any unclassified body of water below the classification level that the DEP expects to adopt (see appendix B).

The Site Location of Development Act requires the Board to "...control the location of those developments substantially affecting local environment in order to ensure that such development will be located in a manner which will have a minimal adverse impact on the natural environments or their surroundings." This includes projects larger than 20 acres (8 ha) and those covering more than 60,000 sq ft. This act

requires persons proposing such development in an organized township to obtain a permit from the DEP. The permit will be either granted or denied depending upon several criteria, two of which are that no unreasonable adverse effect on the natural environment will occur and that the proposed development will be built on soil types that are suitable to the nature of the undertaking. The Land Use Regulation Commission administers this law in unorganized townships.

Administered by DEP, the Solid Waste Management Act includes certain criteria developed to protect ground and surface water resources. The major criteria include: (1) all refuse must be placed at least 5 feet (1.5 m) above the level of groundwater, (2) site sloping must be less than 15%, (3) site boundary limits must not be closer than 300 feet (92 m) to a classified body of water, (4) site boundary limits must not be closer than 1000 feet (305 m) to the nearest residence or potable water supply, and (5) surficial material must consist of well-graded granular material containing from 15% to 40% fine sands and must be relatively free of cobbles. This act is designed to protect all freshwater aquatic habitats from runoff from solid waste in organized townships.

The Oil Discharge Prevention and Pollution Control Act is designed (1) to protect the coast of Maine from damage caused by oil spillage, by prohibiting the unlicensed discharge of oil (coastal waters extending 12 miles, 19 km, seaward), and (2) to regulate the manner in which transfers of oil are conducted. Although DEP holds the major responsibility for decision-making with regard to licenses and conditions and violations of this act, several other State agencies are involved in administering it. The Division of Oil Conveyance Services of the Department of Environmental Protection is in charge of administering licenses, cleaning up oil spills, and research and development. Enforcement is the duty of the State Attorney General. The Department of Marine Resources (MDMR) and U.S. Coast Guard must be consulted for advice before any anchorage regulation is adopted.

The Stream Alteration Act applies to freshwater aquatic areas. This act, administered by the DEP protects (through issuance of permits upon approval by the Commissioner) all streams, rivers, or brooks or the adjacent land against any dredge, fill or construction activities. Any palustrine wetland adjacent to or contained within a stream, river, or brook is protected under this act. Certain lakes also are protected, as this law applies to tributaries, of which

lakes are often a part. A large number and acreage of palustrine wetlands and some lakes are not regulated under this act.

The Mandatory Shoreland Zoning Act administered by DEP requires all organized towns to establish zoning controls on all navigable ponds, lakes, rivers, and streams and ocean frontage (land 250 feet or 76 m within the high water mark). Palustrine wetlands, steep slopes, and floodplains associated with these water bodies are classified as Resource Protection Districts. Palustrine wetlands not associated with the above types of water bodies may be zoned by individual towns as Resource Protection Districts. Those towns that have failed to comply with Mandatory Shoreland Zoning Act are under State zoning jurisdiction.

The Subdivision Law requires all municipal authorities in organized townships to assure that a proposed development meets certain standards. For approval, the proposed development must have (1) a sufficient supply of water, (2) an adequate method of sewage disposal, (3) must not cause undue air and water pollution, soil erosion, or unsafe highway conditions, and (4) must not interfere with scenery. All requests for subdivision (three or more lots created within a 5-year period) approval must be reviewed by the municipal planning board. The Land Use Regulation Commission enforces the Subdivision Law in unorganized townships.

The Land Use Regulation Law promotes principles of sound land use planning in unorganized areas. The Land Use Regulation Commission has planning and zoning powers and development control over townships, plantations, and coastal islands that are unorganized. The areas under its jurisdiction are divided into protection, management, and development districts. Any activities within "protection subdistricts" must be approved by the Commission. Palustrine wetlands may be zoned under four of these protection subdistricts (Unusual Wetland, Fish and Wildlife, Shoreland, and Great Pond). Lacustrine and riverine areas may be zoned under six of these subdistricts (Flood Prone, Fish and Wildlife, Great Pond, Recreation, Shoreland, and Unusual Wetland).

The Great Ponds Act, which applies to lacustrine systems, prohibits construction without a permit of causeways, bridges, marinas, wharves, and other permanent structures, and filling and dredging in or on land adjacent to Great Ponds [natural lakes larger than 10 acres (4ha), and artificial lakes larger than 30 acres (12 ha) owned by two

or more parties]. The Great Ponds Act may apply to a limited number of open water palustrine habitats that have been classified by the State as Great Ponds. The DEP is the State agency responsible for administering the Great Ponds Act. Applications are reviewed by DEP staff with recommendations from other State departments (particularly MDIFW) and, in unorganized townships, the Land Use Regulation Commission.

The Critical Areas Program of the State Planning Office influences the regulation of aquatic habitats. This program registers the locations of unique and critical areas, such as unique bogs, rare plants, colonial waterbird colonies, and unusual plant communities.

MDIFW owns, protects, and manages palustrine and riverine wetland areas in the coastal zone. Wetlands under MDIFW ownership are ensured protection.

MDIFW and the FWS (Moosehorn National Wildlife Refuge) have been involved in marsh protection and management programs (palustrine, riverine, and lacustrine wetlands) intended to improve habitats for waterfowl. In addition, these organizations manage coastal wetlands and islands used by migratory birds (see atlas map 3).

Regulations Pertaining to Estuarine and Marine Systems in Coastal Maine

Several direct Federal and State controls exist over the estuarine and marine systems in Maine. Federal agencies with direct regulatory authority over these systems are the EPA, the U.S. Coast Guard, and the COE.

The EPA controls discharge of pollutants in all waters of the U.S., including the estuarine and marine systems. Along with the U.S. Coast Guard, EPA regulates spills of oil and hazardous substances that may occur in the estuarine and marine systems. EPA and COE (COE has the permit authority to regulate activities involving discharges of dredged or fill material in all waters of the U.S) provide the framework for reviewing proposed discharges of dredged or fill materials to evaluate their physical effects and potential for chemical contamination.

Although the FWS has no direct regulatory control over the estuarine and marine systems, it plays a direct advisory role in regulatory practices. Under the Fish and Wildlife Coordination Act, FWS must assess the impacts on fish and

wildlife of all water and water-related land resource development projects that are funded by the Federal Government or constructed under a permit or license. It provides information to federal construction or regulatory agencies and to permit applicants. Such involvement includes analyzing and reporting on construction proposals and applications for dredge and fill permits issued by the COE, ocean-dumping permits issued by the EPA, bridge and causeway permits issued by the U.S. Coast Guard, license applications submitted to the Federal Power Commission and Nuclear Regulatory Commission, and any proposed Federal construction affecting living fish and wildlife resources. FWS also plays a direct role in regulatory practices concerning the estuarine and marine systems through its acquisition of significant migratory waterfowl habitat (under the Migratory Bird Conservation Act) and of habitat for endangered species (under the Migratory Bird Conservation Act) and of habitat for endangered species (under the Endangered Species Act), and recreation and wilderness areas (under the Water Conservation Act). All acquisitions become part of the National Wildlife Refuge System.

The National Marine Fisheries Service's primary responsibility is to protect and conserve the estuarine, marine, and anadromous fish resources. Twenty Federal laws mandate NMFS involvement in fish habitat protection. NMFS also has an advisory role similar to that of the FWS in evaluating Federal permits. In addition, NMFS has primary responsibility in the designation and management of marine and estuarine sanctuaries.

Other Federal agencies that play an indirect role in regulations concerning the estuarine and marine systems in coastal Maine are the Soil Conservation Service (technical assistance programs in relation to resource conservation), National Park Service (acquisition and management), and U.S. Geological Survey (research).

On the State level, nine laws manage coastal resources found primarily in tidal water, by guiding development and by conserving natural resources identified by the State or municipality as being in need of protection. (Seven of these: the Site Location of Development Act, the Protection and Improvement of Waters Act, the Mandatory Shoreland Zoning Act, the Oil Discharge and Pollution Control Act, the Land Use Regulation Act, the Critical Areas Program Act, and the jurisdiction of the MDIFW in wildlife management areas have been discussed previously, as they apply to freshwater aquatic systems as well.) The Coastal Wetland Act and

Marine Resources Management Law pertain exclusively to tidal waters (estuarine, marine, and riverine).

The Coastal Wetlands Act ensures that dredging, draining, filling, or construction of permanent structures on or over any tidal or subtidal land does not (1) unreasonably interfere with existing navigational or recreational uses, (2) cause unreasonable soil erosion, (3) unreasonably interfere with the natural flow of any waters, (4) unreasonably harm wildlife or freshwater, estuarine, or marine fisheries, or (5) lower the quality of any waters. This law is administered by the DEP or by those municipal governments to which permit authority has been granted by the DEP (e.g., Harrington and Southport).

The Marine Resources Management Law, as administered by MDMR, protects any of the renewable marine resources (including fish, shellfish, marine worms, and marine plants) of the State through enforceable regulations of the time, method, number, weight, length, and location a species is taken. Enforcement is carried out by wardens of MDMR.

Regulations Pertaining to Terrestrial Systems

Federal regulations of land-based development primarily concern discharge of pollutants (e.g., air, water, solid wastes, and hazardous wastes). If the project is funded by the Federal Government or involves federally owned land, an Environmental Assessment and/or an Environmental Impact Statement must be filed in accordance with the National Environmental Policy Act.

On the State level, 6 laws have direct regulatory control over development. (Four laws, the Mandatory Shoreland Zoning Act, the Subdivision Law, the Site Location of Development Act and the Solid Waste Management Law, are described above.) The applications of the Land Use Regulation Law and the Protection and Improvement of Air Law to the terrestrial system are summarized below. Individual towns may further control and guide development through municipal zoning and local ordinances. Under the Land Use Regulation Law, the Land Use Regulation Commission was created. This commission is instructed by the law "to extend principles of sound planning, zoning, and subdivision control for the unorganized...townships of the state..." The Commission thus exerts considerable control over development within its jurisdiction. Through zoning, development is directed to areas that have good soils and areas where building has already taken place; and fragile areas that may be unsuitable for construction are avoided.

The Land Use Regulation Commission's jurisdiction is divided into protection, management, and development districts in accordance with the following standards:

1. Protection districts: areas where development would jeopardize significant natural, recreational, and historical resources, including but not limited to floodplains, precipitous slopes, wildlife habitat, and other areas critical to the ecology of the State.
2. Management districts: areas that are appropriate for commercial forestry or agricultural uses, for which plans for additional development are not formulated presently, and in which additional development is not anticipated.
3. Development districts: areas discernible as having patterns of intensive residential, recreational, commercial, or industrial use, or commercial removal of minerals or other natural resources. Areas that are devoted to or suitable for intensive development.

The Commission may delineate such subcategories of the above classifications as may be deemed necessary and desirable to carry out the intent of the law. All major activities occurring within these major districts are under the authority of the Land Use Regulation Commission.

The Protection and Improvement of Air Law is intended to control all air emissions in order to protect public health, property, and natural resources. This law prohibits open burning and specifies the circumstances under which open burning may be conducted. (Agricultural burning, burning for the disposition of materials generated by the demolition of a building, burning to clear land prior to construction, burning to control or prevent disease, and burning for training, research, and recreational purposes all require permits.) Forest rangers or town forest-fire wardens may grant open burning permits. All permits for burning carry a requirement that the environment, public health, and property not be endangered.

Appendix II

Class A, B and C Wildlife Habitats of Penobscot Bay.

Class/ Area Number	Area Name	Location
Class A		
P01	Hewett-Graffam-Pleasant Islands	Muscle Ridge
P23	Stockton Harbor	Searsport, Stockton Springs
P25	Fort Point Cove	Stockton Springs
P27	Orland River	Verona, Orland

P237	North Deer Isle	Deer Isle
P238	Reach-Oak Point	Deer Isle

Appendix III

Maine's Endangered, Threatened, and Special Concern Wildlife

CATEGORY I. ENDANGERED SPECIES

Definition: A Maine Endangered Species is a species in immediate danger of extirpation from Maine due to critically low or declining numbers brought about by habitat loss or degradation, overexploitation, pollution, disease or other factors. This definition includes any species that spends a biologically significant part of its annual or life cycle within the State of Maine and is not limited just to species that breed in Maine.

Any indigenous wildlife species that has been documented to be in danger of extirpation within the State of Maine shall be included.

Continued survival of these species within the State of Maine is unlikely without implementing special protective measures.

Any Federally listed Endangered Species occurring within the State of Maine will be included in this category.

Maine Endangered Species:

1. Bald Eagle - Haliaeetus leucocephalus*
2. Peregrine Falcon - Falco peregrinus*
3. Golden Eagle - Aquila chrysaetos
4. Piping Plover - Charadrius melodus**
5. Least Tern - Sterna antillarum
6. Sedge Wren - Cistothorus platensis
7. Grasshopper Sparrow - Ammodramus savannarum
8. Right Whale - Eubalaena glacialis*
9. Humpback Whale - Megaptera novaeangliae*
10. Finback Whale - Balaenoptera physalus*
11. Sperm Whale - Physeter catodon*
12. Sei Whale - Balaenoptera borealis*
13. Leatherback Turtle - Dermochelys coriacea*
14. Atlantic Ridley Turtle - Lepidochelys kempi*
15. Box Turtle - Terrapene carolina
16. Black Racer - Coluber constrictor

*Federally listed Endangered Species

**Federally listed Threatened Species

CATEGORY II. THREATENED SPECIES

Definition: A Maine Threatened Species is not as critically jeopardized by extirpation as an Endangered Species, but will probably become Endangered if current population levels experience further declines. This definition includes any species that spends a biologically significant part of its annual or life cycle in the State of Maine and is not limited just to species that breed in Maine.

Any indigenous wildlife species that has been documented to be rare or declining within the State of Maine and which is likely to become Endangered in Maine in the foreseeable future shall be included.

Any Federally listed Threatened Species occurring in Maine will be included in this category or in Category I, Endangered.

Maine Threatened Species:

1. Tundra Peregrine Falcon - Falco peregrinus tundrius*
2. Roseate Tern - Sterna dougallii
3. Northern Bog Lemming - Synaptomys borealis
4. Loggerhead Turtle - Caretta caretta*
5. Blanding's Turtle - Emydoidea blandingii
6. Spotted Turtle - Clemmys guttata

*Federally listed Threatened Species

CATEGORY III. SPECIAL CONCERN SPECIES

Definition: The intent of the Special Concern category is to focus attention on a species before it becomes State Threatened or Endangered. Species listed in this category include:
1) species whose populations are not in immediate danger of extirpation, but are believed to be suffering a decline that could eventually threaten the species if allowed to go unchecked, 2) rare species whose populations are relatively stable, but that occur in such small numbers or have such specialized habitat requirements or restricted distributions that they are particularly vulnerable.

Any indigenous wildlife species for which there is documentation that it could easily become Threatened or Endangered within the State of Maine because it is: 1) suffering a noncyclic population decline, or 2) occurs in precariously small numbers, or 3) has a restricted distribution or specialized habitat requirement, shall be included in this category.

Maine Special Concern Species:

1. Harlequin Duck - Histrionicus histrionicus
2. Common Tern - Sterna hirundo
3. Arctic Tern - Sterna paradisaea
4. Water Pipit - Anthus spinoletta
5. New England Cottontail - Sylvilagus transitionalis
6. Ribbon Snake - Thamnophis sauritus
7. Landlocked Arctic Charr - Salvelinus alpinus

RESOURCE MAPS

RESOURCE MAPS

The following series of maps delineate Class A, B and C wildlife habitats for each of the thirty-six towns evaluated in this study.

Bangor	North Haven
Belfast	Northport
Brewer	Orland
Brooklin	Orrington
Brooksville	Owls Head
Bucksport	Penobscot
Camden	Prospect
Castine	Rockland
Deer Isle (1)	Rockport
Deer Isle (2)	Searsport
Deer Isle (LURC)	Sedgwick
Frankfort	Stockton Springs
Frenchboro	Stonington
Hampden	Swans Island
Isle au Haut	Veazie & Eddington
Islesboro	Verona
Lincolnville	Vinalhaven
Matinicus & Criehaven	Winterport
Muscle Ridge Islands	

The locations of Special Wildlife Features are also indicated by special symbols. A list of major marine wildlife species/species groups observed in the areas during each of the five seasonal periods accompanies each map.

LEGEND

MAP SYMBOLS:

Bald eagle nest site

Osprey nest(s)

Colonial-nesting seabird island

Shorebird feeding and roosting area

Great blue heron colony

Eider molting site

Seal haul-out

AREA CLASSIFICATION:

Class A (national and/or state significance)

Class B (regional significance)

Class C (local significance)

BANGOR

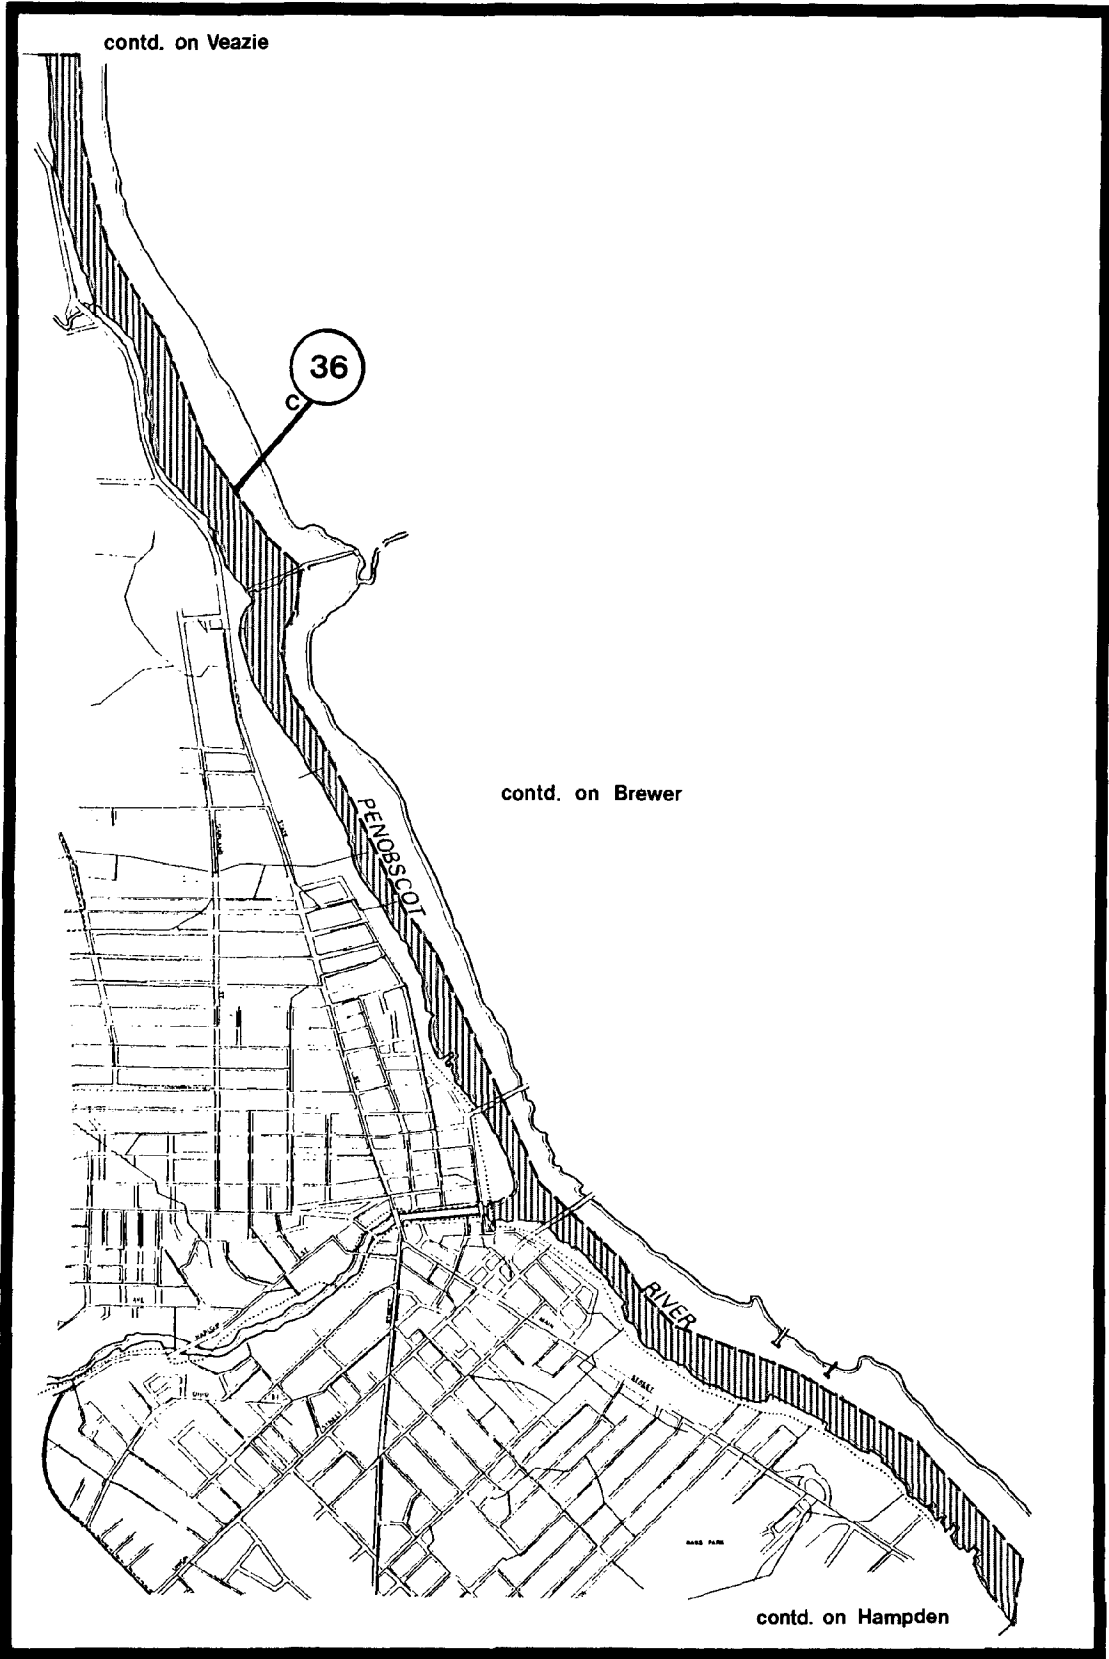

Marine Wildlife of Penobscot Bay by Wildlife Area and Season of Occurrence.
(W=winter, S=spring migration, N=nesting, P=post nesting, F=fall migration)

P036 Bangor

Bald Eagles (F*)	Black-Backed Gulls (P,F)
Cormorants (N,P,F)	Gulls (P,F*)
Goldeneye/Bufflehead (S)	Herring Gulls (W,S,N,P,F)
Ospreys (P*)	Shorebirds (P)
Small Gulls (F)	Unid. Waterfowl (W,N*,F*)

* - Indicates the presence of greater than 1% of the species' population
in Penobscot Bay for the season identified.

BANGOR

BELFAST

Marine Wildlife of Penobscot Bay by Wildlife Area and Season of Occurrence.
(W=winter, S=spring migration, N=nesting, P=post nesting, F=fall migration)

P017 Belfast Reservoir

Black-Backed Gulls (W,S,P,F)	Cormorants (N,P,F)
Eiders (S,N,F)	Goldeneye/Bufflehead (W,S,F*)
Herring Gulls (W*,S,N,P,F)	Harbor Seals (F)
Loons (W,P*,F*)	Mergansers (S,N)
Old Squaws (W,S)	Shorebirds (P)
Small Gulls (F)	Unid. Waterfowl (W,S*,N,F*)

P018 Belfast Harbor

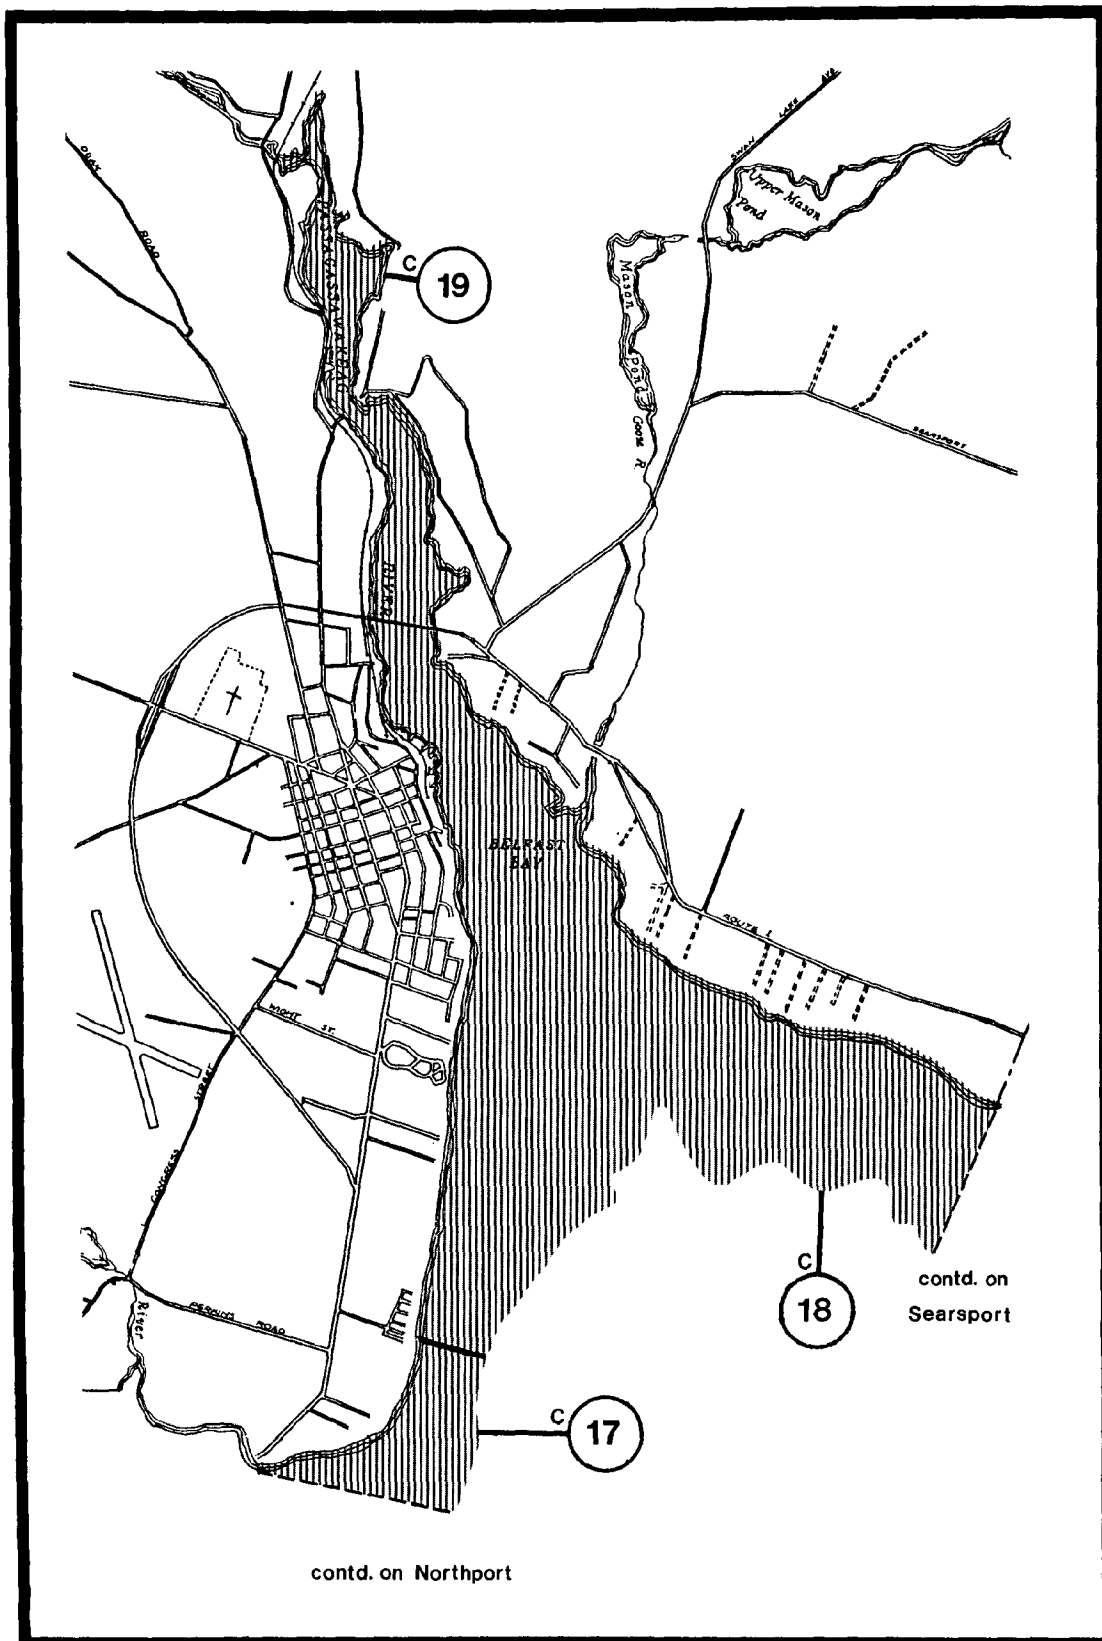

Black Ducks (W,F*)	Black-Backed Gulls (W,S,N,P)
Cormorants (N,P,F)	Eiders (S,N)
Gulls (S*,P*,F*)	Goldeneye/Bufflehead (W*,S*,F*)
Herring Gulls (W*,S*,N,P,F*)	Loons (S,N*,P*)
Mergansers (W,S,N*,F)	Ospreys (P*)
Old Squaws (W,S,F)	Shorebirds (N)
Small Gulls (P*,F*)	Terns (P)
Unid. Waterfowl (W,S*,N)	

P019 Passagassawaukeag River

Black Ducks (W)	Black-Backed Gulls (P)
Cormorants (P,F)	Canada Geese (S*)
Goldeneye/Bufflehead (W,S*,F*)	Herring Gulls (W,S,N,P,F)
Shorebirds (P)	Small Gulls (F*)
Unid. Waterfowl (W*,F*)	

* - Indicates the presence of greater than 1% of the species' population in Penobscot Bay for the season identified.

BELFAST

BREWER

Marine Wildlife of Penobscot Bay by Wildlife Area and Season of Occurrence.
(W=winter, S=spring migration, N=nesting, P=post nesting, F=fall migration)

P035 Hampden

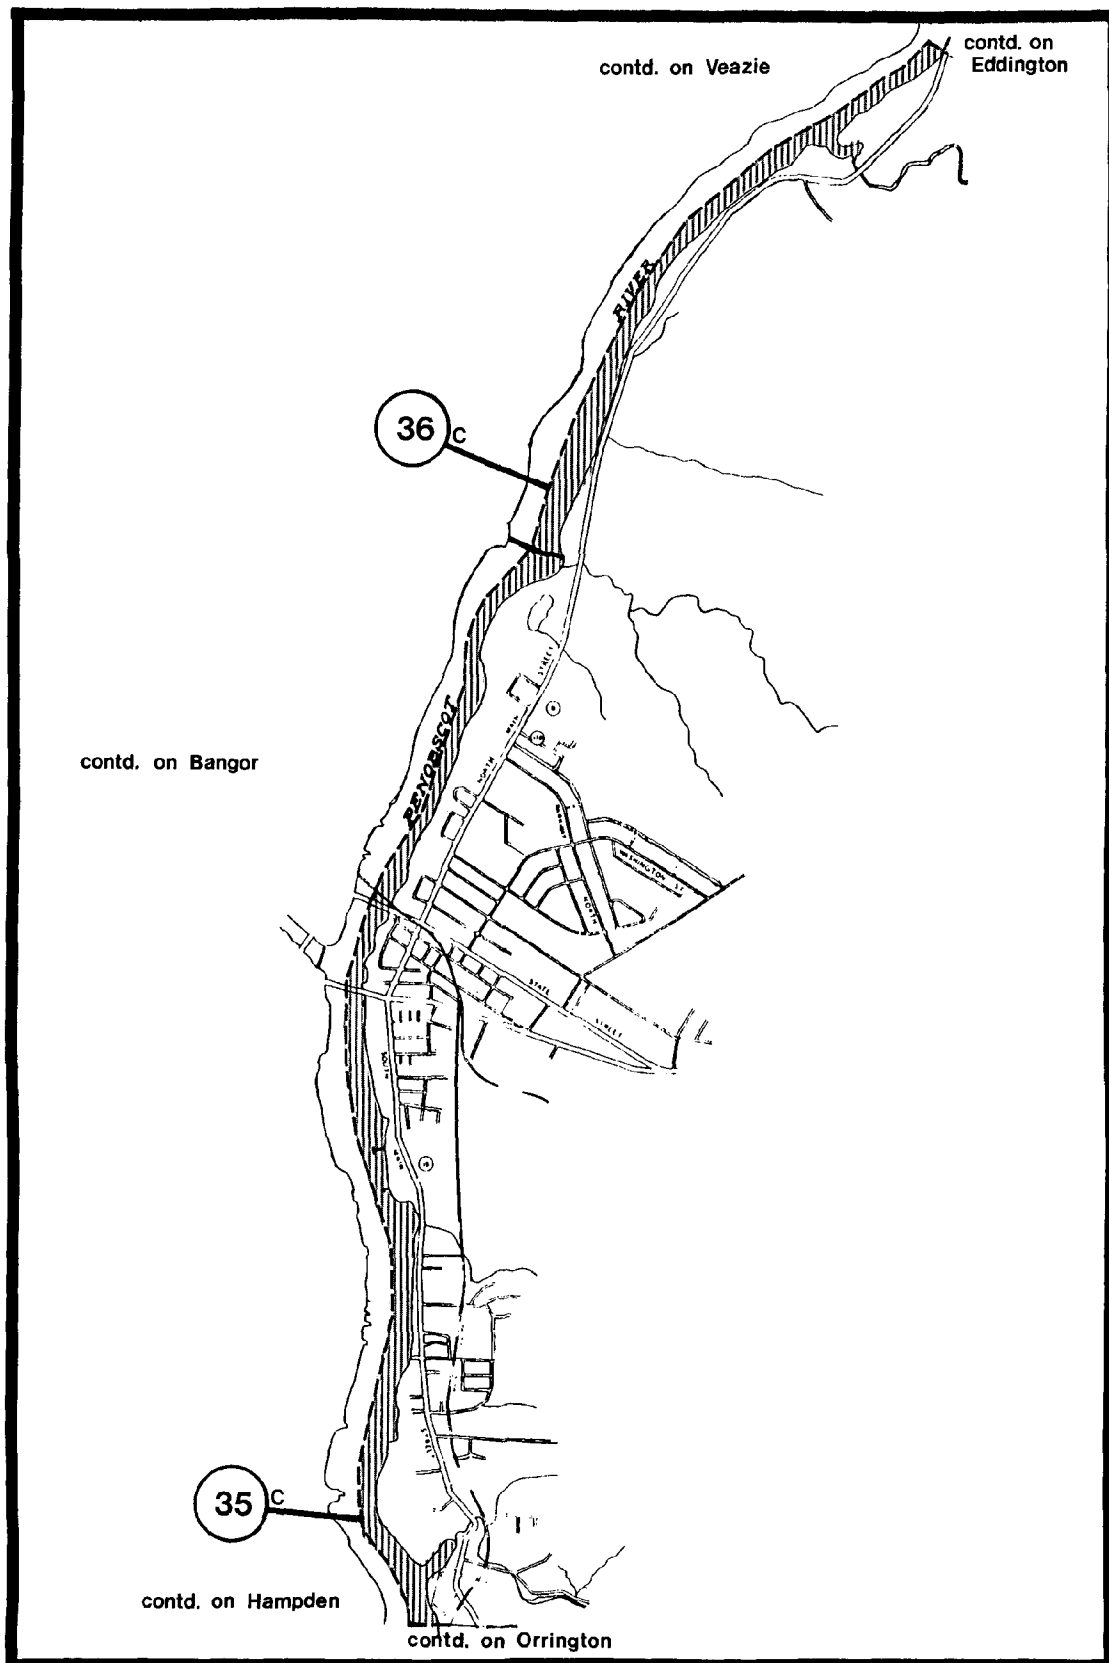

Black Ducks (P,F)	Black-Backed Gulls (N,F)
Cormorants (N,P)	Gulls (W,P,F)
Great Blue Herons (P)	Goldeneye/Bufflehead (S)
Herring Gulls (W,S,N,P,F)	Loons (P*)
Small Gulls (P)	Unid. Waterfowl (S*)

P036 Bangor

Bald Eagles (F*)	Black-Backed Gulls (P,F)
Cormorants (N,P,F)	Gulls (P,F*)
Goldeneye/Bufflehead (S)	Herring Gulls (W,S,N,P,F)
Ospreys (P*)	Shorebirds (P)
Small Gulls (F)	Unid. Waterfowl (W,N*,F*)

* - Indicates the presence of greater than 1% of the species' population
in Penobscot Bay for the season identified.

BREWER

BROOKLIN

Marine Wildlife of Penobscot Bay by Wildlife Area and Season of Occurrence.
(W=winter, S=spring migration, N=nesting, P=post nesting, F=fall migration)

P229 Naskeag Point

Black-Backed Gulls (S,N,P,F)	Cormorants (N,P,F)
Eiders (W,S,N,P,F)	Goldeneye/Bufflehead (W*,S*,F)
Grebes (S*)	Guillemots (N,P)
Herring Gulls (W*,S*,N,P,F*)	Loons (W)
Mergansers (W,F)	Osprey Nests (N)
Old Squaws (W,S)	Scoters (W,S)

P230 Babson Island

Black-Backed Gulls (P)	Cormorants (P,F)
Eiders (W,S,N,P,F)	Goldeneye/Bufflehead (W,S)
Herring Gulls (W,P,F)	Harbor Seals (N)
Loons (P*,F)	Ospreys (P*)
Osprey Nests (N)	Old Squaws (W,S,F)
Scoters (W)	

P231 High Head

Black Ducks (W)	Black-Backed Gulls (W,S,N,P)
Eiders (W,S,N,P,F)	Goldeneye/Bufflehead (W,S,F)
Herring Gulls (W,S,N,P,F)	Harbor Seals (S)
Mergansers (W)	Old Squaws (W)

P232 Torrey Islands

Bald Eagles (S*)	Black-Backed Gulls (N,P,F)
Cormorants (P,F*)	Eiders (W,S,N*,P,F)
Goldeneye/Bufflehead (W,S,F)	Herring Gulls (W,S,N,P,F)
Harbor Seals (S,F)	Loons (W,F)
Mergansers (W,S,F)	Osprey Nests (N)
Old Squaws (W,S,N,F)	Scoters (F)
Small Gulls (P)	Unid. Waterfowl (W)

P233 Brooklin

Bald Eagles (F*)	Black-Backed Gulls (N,P,F)
Cormorants (P,F)	Eiders (W,S,N,P,F)
Goldeneye/Bufflehead (W*,S,F)	Grebes (W*,S*)
Herring Gulls (W*,S,N,P,F)	Harbor Seals (F)
Loons (S,N*,P*,F)	Mergansers (W,P*,F)
Osprey Nests (N)	Old Squaws (W*,S,N*,F)
Scoters (W)	Small Gulls (P)
Unid. Waterfowl (W)	

P234 Benjamin River

Black Ducks (W)	Black-Backed Gulls (S,P)
Cormorants (N,P,F)	Eiders (W,S,N,P,F)
Great Blue Herons (P)	Goldeneye/Bufflehead (W*,S*,F)
Herring Gulls (W*,S,N,P,F)	Harbor Seals (P,F)
Loons (N*,F)	Mergansers (F)
Old Squaws (W,S,F)	Scoters (W,S,F)
Small Gulls (P)	Unid. Waterfowl (N*,F)

P236 Mahoney Island

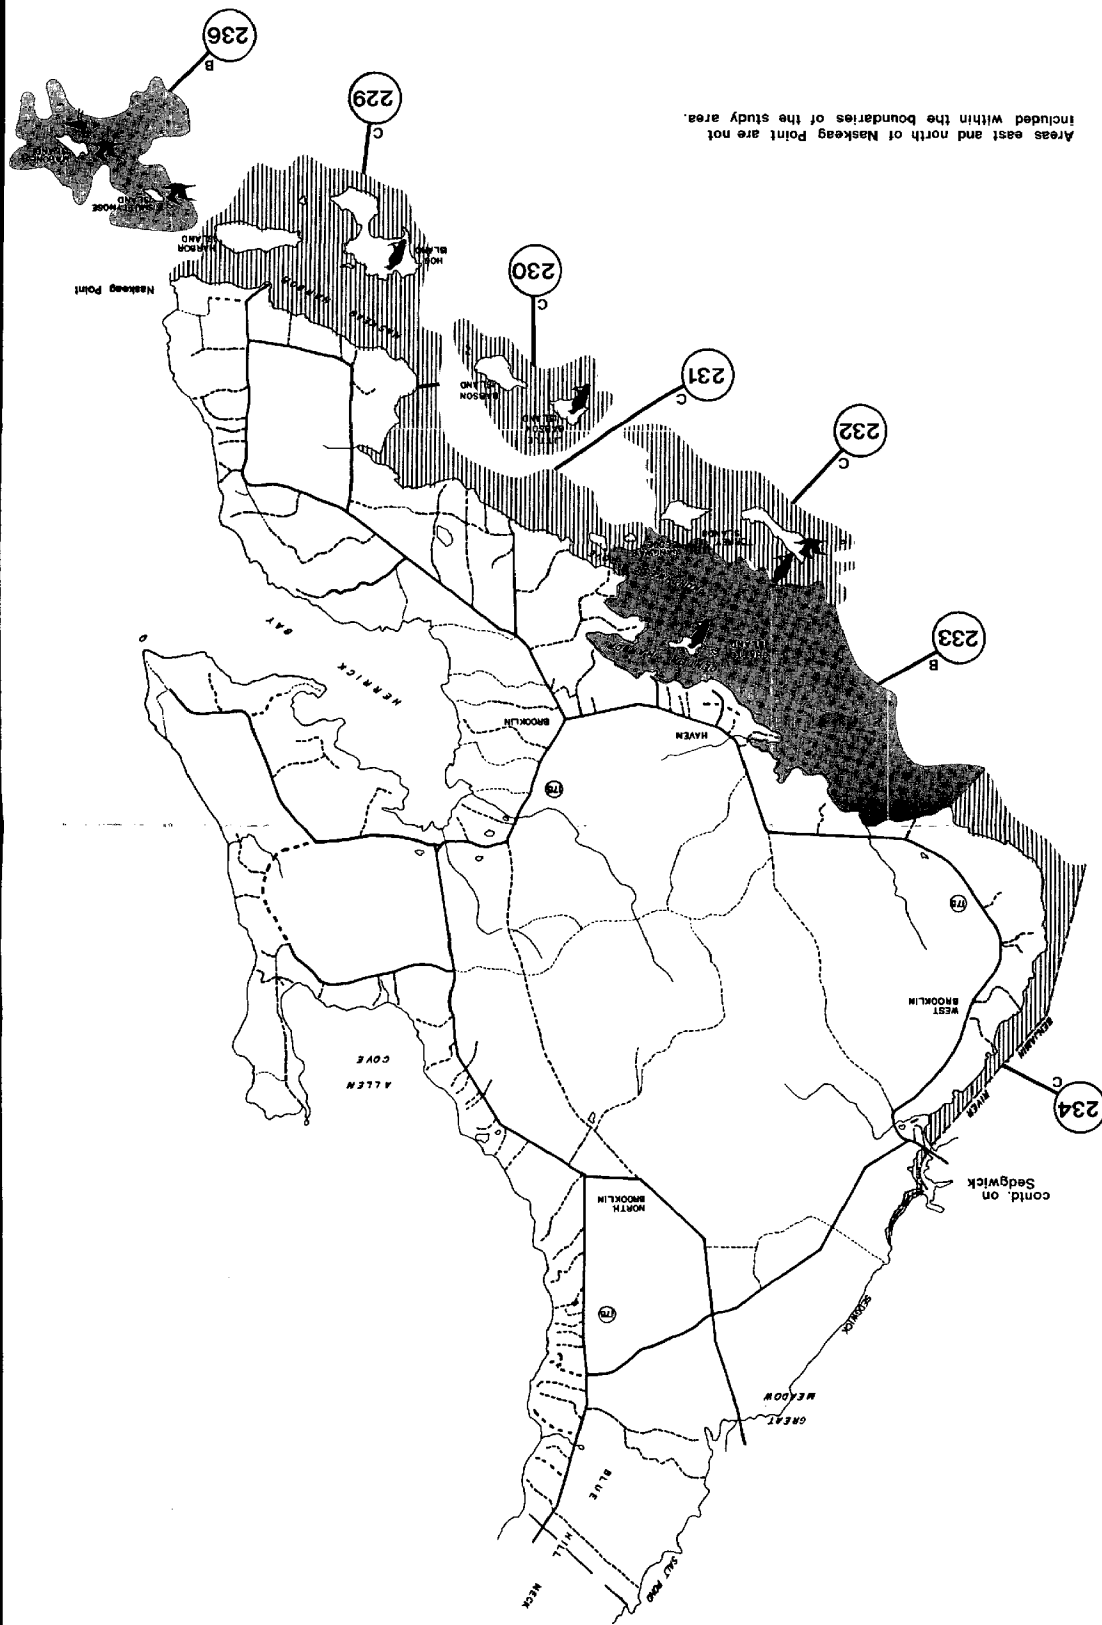

Black Ducks (W)	Bald Eagles (W*)
Black-Backed Gulls (S,N,P,F)	Cormorants (N*,P*,F)
Eiders (W,S,N*,P,F)	Gulls (S*)
Grebes (S*)	Guillemots (N,P)
Herring Gulls (W,N*,P*,F)	Harbor Seals (N,F)
Loons (W,S*,F)	Mergansers (W,S)
Old Squaws (W,S,F)	Scoters (W*)
Shorebirds (W*)	Unid. Waterfowl (N*)

* - Indicates the presence of greater than 1% of the species' population in Penobscot Bay for the season identified.

BROOKLIN

BROOKLIN

Areas east and north of Naskeag Point are not included within the boundaries of the study area.

BROOKSVILLE

Marine Wildlife of Penobscot Bay by Wildlife Area and Season of Occurrence.
(W=winter, S=spring migration, N=nesting, P=post nesting, F=fall migration)

P095 Holbrook Island

Black Ducks (W*,S)	Black-Backed Gulls (S,N,P,F)
Blue Wing Teal (F*)	Cormorants (N,P,F)
Eiders (W,S,N,P,F)	Gulls (W*)
Great Blue Herons (W*,P,F*)	Goldeneye/Bufflehead (W,S,F*)
Grebes (S*)	Herring Gulls (W,S,N,P,F*)
Harbor Seals (N,P)	Loons (W,N*,P*,F)
Mergansers (S,N*,F*)	Old Squaws (W,S*,F)
Shorebirds (S)	Unid. Waterfowl (W,F)

P096 Smith Cove

Black Ducks (W*,S,F)	Black-Backed Gulls (P)
Cormorants (N,P,F)	Canada Geese (S*)
Eiders (W,S,N,P,F)	Gulls (W*,N*)
Great Blue Herons (F*)	Goldeneye/Bufflehead (W,S*)
Grebes (S*)	Herring Gulls (W,S*,N,P,F)
Harbor Seals (N,P,F*)	Loons (W*,P*)
Mergansers (W,S,F*)	Old Squaws (W,S*,F)
Scoters (F)	Shorebirds (P,F*)
Unid. Waterfowl (W,S,F*)	

P097 Bagaduce River

Black Ducks (W*,F*)	Bald Eagles (W*)
Black-Backed Gulls (W*,S,N,F)	Cormorants (N,P,F)
Eiders (W,S,N,P,F)	Gulls (W*,P*)
Great Blue Herons (W*,P,F*)	Goldeneye/Bufflehead (W*,S*,F*)
Herring Gulls (W*,S,N,P,F)	Harbor Seals (S)
Loons (W,S,N*,F*)	Mergansers (W,S,N,F)
Old Squaws (W,S,F)	Shorebirds (W,F*)
Small Gulls (F)	Terns (P)
Unid. Waterfowl (W*,S*,F*)	

P098 Northern Bay-Bagaduce

Black Ducks (W,S*,P*,F*)	Bald Eagles (W*)
Black-Backed Gulls (W,S,N,P,F)	Blue-winged Teal (P*)
Cormorants (N,P,F)	Canada Geese (F*)
Eiders (S,N,P)	Eagle Nests (N*)
Gulls (F*)	Great Blue Herons (S*,P*,F*)
Goldeneye/Bufflehead (W*,S*,F*)	Grebes (S*)
Guillemots (N)	Green-winged Teal (F*)
Herring Gulls (W,S*,N,P,F)	Harbor Seals (N,P*,F)
Loons (F)	Mergansers (W*,S,N*,F)
Ospreys (N*)	Old Squaws (W,S,F)
Shorebirds (P*)	Small Gulls (P*,F*)
Terns (P)	Unid. Waterfowl (W)

P099 Herrick Bay-Bagaduce

Black Ducks (S*,P*)	Bald Eagles (P*)
Black-Backed Gulls (F)	Blue-winged Teal (P*)
Cormorants (N,P)	Canada Geese (S*)
Eiders (P)	Eagle Nests (N*)
Gulls (W*,P)	Great Blue Herons (P*)
Goldeneye/Bufflehead (W,S*,F)	Herring Gulls (N,P,F)
Harbor Seals (P*)	Mallards (P*)
Mergansers (W,P*,F)	Shorebirds (P)
Small Gulls (P)	Terns (P)
Unid. Waterfowl (N*)	

P100 Head of the Cape

Black-Backed Gulls (W,N,P)	Cormorants (N,P)
Eiders (S,N,F)	Gulls (W*)
Great Blue Herons (W*)	Goldeneye/Bufflehead (W)
Grebes (S*)	Herring Gulls (W,S,N,P,F)
Loons (W,S,N*,F*)	Mergansers (W,S,N*)
Old Squaws (W,S,F)	Shorebirds (W,P,F)
Terns (P)	Unid. Waterfowl (W,S)

* - Indicates the presence of greater than 1% of the species' population in Penobscot Bay for the season identified.

BROOKSVILLE

Marine Wildlife of Penobscot Bay by Wildlife Area and Season of Occurrence.
(W=winter, S=spring migration, N=nesting, P=post nesting, F=fall migration)

P101 Weir-Horseshoe Coves

Black Ducks (W,S*,P)	Black-Backed Gulls (W,S,N,P)
Cormorants (N,P,F)	Eiders (W,S,N,P,F)
Great Blue Herons (W*,P,F*)	Goldeneye/Bufflehead (W,S,F)
Herring Gulls (W,S,N,P,F)	Harbor Seals (S*,P,F*)
Loons (S)	Mergansers (W*,S,F)
Ospreys (F*)	Old Squaws (W)
Shorebirds (S,P)	Unid. Waterfowl (W,F)

P102 Spectacle Island

Black-Backed Gulls (S,N,P)	Cormorants (N,F)
Eiders (S,N,P,F)	Gulls (S*)
Goldeneye/Bufflehead (W)	Herring Gulls (W,N*,P*,F)
Harbor Seals (N)	Mergansers (W,S)
Old Squaws (S,F)	Terns (N,P*)
Unid. Waterfowl (W)	

P104 Thrumcap-Two Bush Ledges

Black-Backed Gulls (W,N,P,F)	Cormorants (P,F)
Eiders (S,N,F)	Gulls (S)
Goldeneye/Bufflehead (S,F)	Grebes (S*)
Herring Gulls (W,S,N,P,F)	Harbor Seals (N,P)
Mergansers (W*,F)	Old Squaws (W,F)
Terns (N*,P*)	Unid. Waterfowl (W)

P105 Orcutt Harbor

Black Ducks (W,F)	Black-Backed Gulls (N,P,F)
Cormorants (F)	Eiders (S,N,F)
Goldeneye/Bufflehead (W,S,F)	Grebes (S*)

DEER ISLE (2)

Marine Wildlife of Penobscot Bay by Wildlife Area and Season of Occurrence.
(W=winter, S=spring migration, N=nesting, P=post nesting, F=fall migration)

P103 Stave Island

Black Ducks (W)	Black-Backed Gulls (P)
Cormorants (P)	Eiders (P,F)
Great Blue Herons (W*)	Goldeneye/Bufflehead (W,F)
Herring Gulls (W,P,F)	Old Squaws (W)
Shorebirds (P)	

P107 Little Deer Isle - North

Black-Backed Gulls (F)	Cormorants (P,F)
Eiders (S,N,P,F)	Goldeneye/Bufflehead (W,S)
Herring Gulls (W,S,N,P,F)	Harbor Seals (F)
Loons (P*,F)	Mergansers (W,S,F*)
Ospreys (P*)	Old Squaws (W,S*)
Unid. Waterfowl (W,F)	

P109 Little Deer Isle - South

Black-Backed Gulls (N,P,F)	Cormorants (P,F)
Eiders (W,S,N,P,F)	Great Blue Herons (P)
Goldeneye/Bufflehead (W,S)	Grebes (S*)
Herring Gulls (W,S,N,P,F)	Loons (W,S,N*,F)
Mergansers (W,S,F)	Osprey Nests (N)
Old Squaws (W,S)	Shorebirds (W)
Unid. Waterfowl (W)	

P110 Scott-Two Bush Islands

Black-Backed Gulls (S*,N*,P)	Cormorants (N*,P*)
Eiders (W,S,N,F)	Gulls (W*)
Great Blue Herons (W*)	Goldeneye/Bufflehead (W,S,F)
Herring Gulls (W,S,P,F)	Harbor Seals (N)
Loons (W,S)	Mergansers (W)
Ospreys (P*)	Osprey Nests (N*)
Old Squaws (W,S,F)	Scoters (F)
Shorebirds (W,F)	Unid. Waterfowl (S*)

P112 Carney Island

Black-Backed Gulls (P,F)	Cormorants (F)
Eiders (P,F)	Gulls (F*)
Goldeneye/Bufflehead (W,F*)	Herring Gulls (W,P,F)
Loons (W,F)	Ospreys (P*)
Osprey Nests (N*)	Scoters (P*,F*)
Shorebirds (P*,F*)	Small Gulls (P*,F*)
Unid. Waterfowl (W*)	

P113 Pickering Island

Black Ducks (F)	Black-Backed Gulls (N,P,F)
Cormorants (N,P,F)	Eiders (S,N,P,F)
Great Blue Herons (P)	Goldeneye/Bufflehead (S,F)
Grebes (S*)	Herring Gulls (S,N,P,F)
Harbor Seals (N,P,F)	Loons (P*,F*)
Mergansers (S,F)	Ospreys (S*,P*)
Osprey Nests (N*)	Old Squaws (S,F)
Shorebirds (P,F*)	Small Gulls (P)
Terns (P)	Unid. Waterfowl (S*)

P115 Bradbury-Crow Islands

Bald Eagles (F*)	Black-Backed Gulls (N,P,F)
Cormorants (N,P,F)	Eiders (S,N,P,F)
Gulls (P)	Grebes (S*)
Herring Gulls (N,P,F)	Harbor Seals (N*,P*,F)
Loons (S*,N*,P*,F*)	Mergansers (S,F)
Osprey Nests (N*)	Old Squaws (S,F)
Shorebirds (P,F)	Unid. Waterfowl (S)

P116 Hardhead Island

Black-Backed Gulls (S*,N*,P*,F)	Cormorants (N*,P*)
Eiders (S,N,P,F)	Guillemots (N*,P*)
Herring Gulls (S*,N,P,F)	Loons (S)
Old Squaws (F)	Shorebirds (P,F)

* - Indicates the presence of greater than 1% of the species' population in Penobscot Bay for the season identified.

DEER ISLE (2)

Marine Wildlife of Penobscot Bay by Wildlife Area and Season of Occurrence.
(W=winter, S=spring migration, N=nesting, P=post nesting, F=fall migration)

P237 North Deer Isle

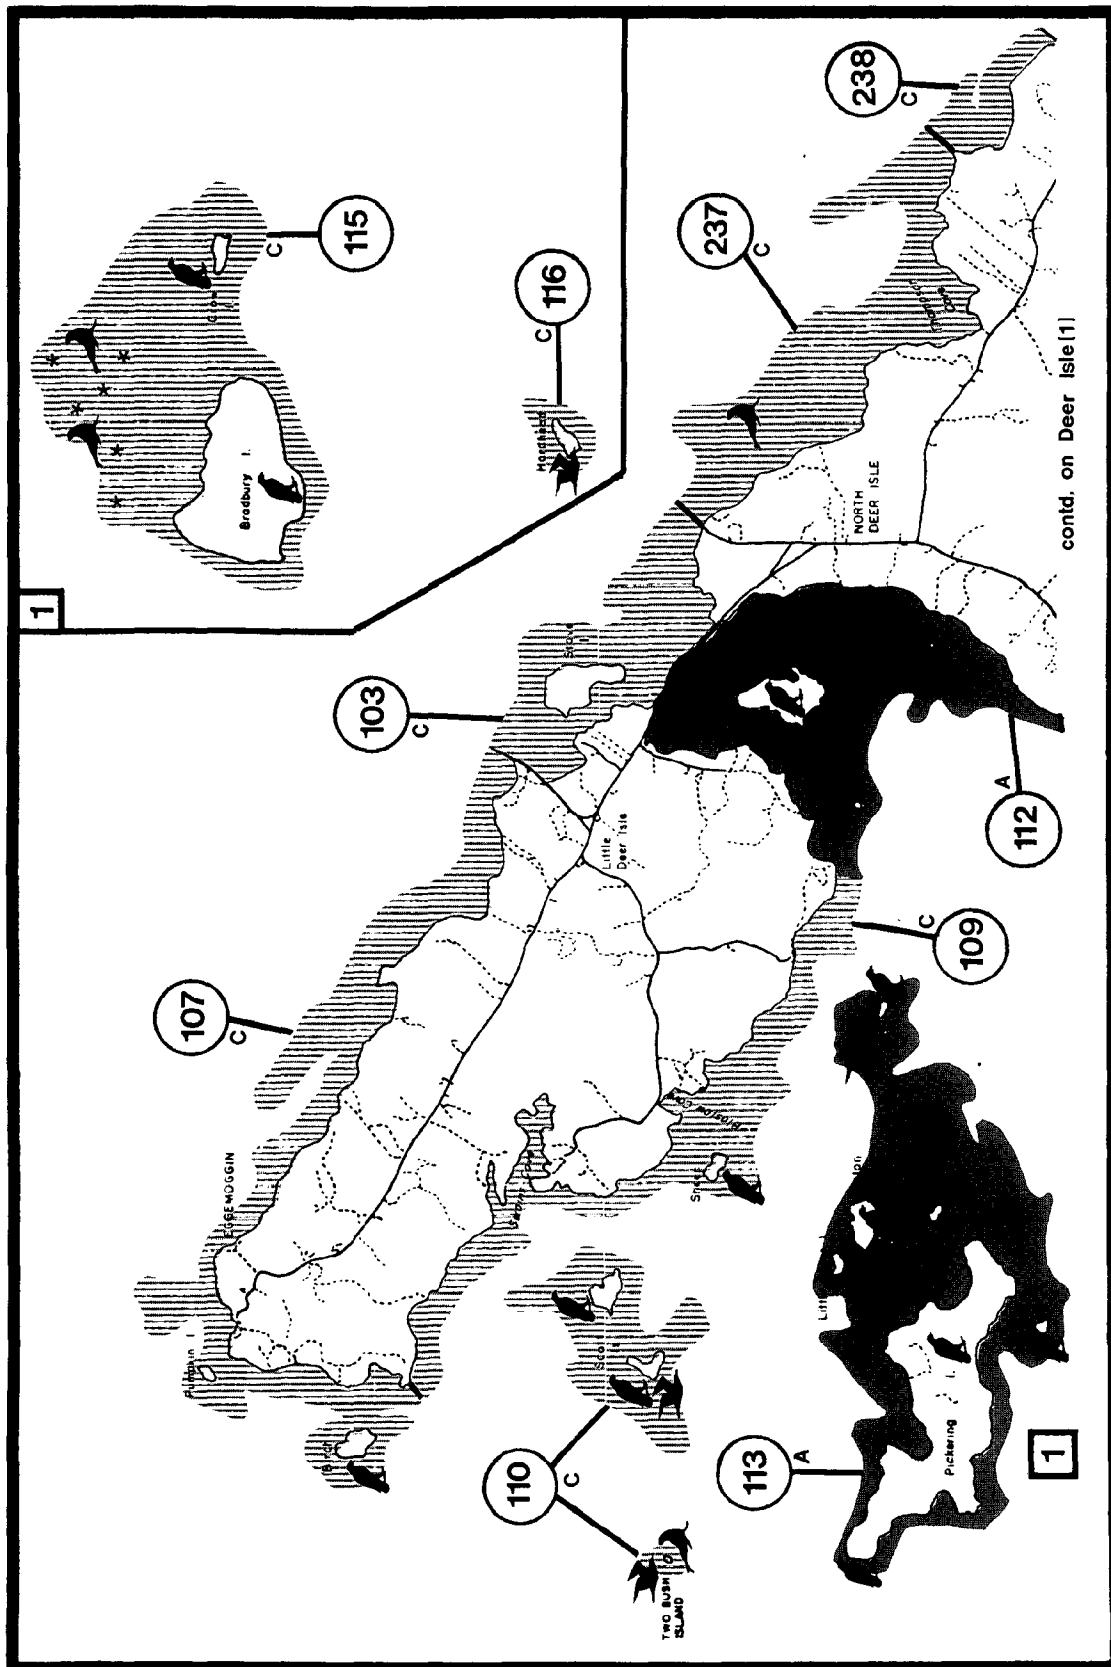

Cormorants (P)	Eiders (S,P,F)
Goldeneye/Bufflehead (W,S)	Herring Gulls (W,S,P,F)
Harbor Seals (P)	Loons (F)
Mergansers (S)	Old Squaws (W)
Scoters (F)	Unid. Waterfowl (S)

P238 Reach-Oak Point

Black Ducks (S)	Black-Backed Gulls (W,S,F)
Cormorants (F)	Eiders (W,S,N,P,F)
Gulls (F)	Great Blue Herons (P)
Goldeneye/Bufflehead (W*,S*,F)	Herring Gulls (W,S,N,P,F)
Harbor Seals (F)	Loons (W,S,P*,F*)
Mergansers (W,S,F)	Old Squaws (S,F)
Scoters (W,S,F*)	Shorebirds (F)
Unid. Waterfowl (W)	

* - Indicates the presence of greater than 1% of the species' population
in Penobscot Bay for the season identified.

* - Indicates the presence of greater than 1% of the species' population
in Penobscot Bay for the season identified.

A black and white map of the Trestle Point area. The map shows a network of roads including 'TRESTLE POINT ROAD', 'J. ROAD', 'ROUTE 1A', 'RD', 'WALDO', 'BELFAST', and 'OLD'. Key geographical features include 'Eastern Mtn 376 X' and 'Mosquito Mtn X'. Water bodies are labeled 'Trestle Point' and 'MARSH BAY'. The map is divided into sections by a large black area. Labels indicate 'contd. on Winterport' at the top, 'contd. on Prospect' on the right, and 'contd. on Prospect' at the bottom. A circled number '32' with a line pointing to the black area is labeled 'A'.
